Genesis S. Parel, MAEd
Research Adviser

Abstract: *Under the K-12 program is the Senior High School Program, an additional two years in high school, implemented and incorporated into schools in 2017 to create a functional basic education system that will develop productive and responsible citizens equipped with the essential competencies, skills, and values for both lifelong learning and employment. This study traced the career status progression of Senior High School Alums of Calasiao Comprehensive National High School in the school year 2017-2018 in the last five years to evaluate the attainment of such endeavors. The respondents typically pursued a plan aligned to their graduated strand despite a lack of career guidance influence. While the Senior High School Program was helpful in college preparation, it does not guarantee immediate readiness for work, which is especially evident in 2022, when despite most college courses requiring four years to complete, very few are currently earning by either employment or business.*

Keywords: *Curriculum Exit, Career Guidance, Tracer Study, K-12, Senior High School*
INTRODUCTION

In 2012, the K to 12 program was launched and implemented in the Philippines under former President Benigno S. Aquino. The year after, it started as a law. The Enhanced Basic Education Act of 2013 (Republic Act 10533) aims to enhance the educational system of the country in order to accelerate the mutual recognition of Filipino graduates and professionals worldwide (Dizon and Calbi, et al., 2019). Under the K-12 program is the Senior High School Program, an additional two years in high school, which was implemented and incorporated into schools in 2017 to create a functional basic education system that will develop productive and responsible citizens equipped with the essential competencies, skills, and values for both lifelong learning and employment whatever curriculum exit they choose. Curriculum exit refers to what learners pursue after high school, from higher education to middle-level skills to

entrepreneurship or employment (Cabral & Abanto, 2020). It is the actions and things they will do after they leave high school. Usually, students struggle to choose their curriculum exit and what career opportunity to pursue after graduation. However, Senior High School helps provide sufficient career guidance and mastery of essential basic, applied, and specialized skills according to their interests. The Senior High School program was also implemented as part of the K-12 Curriculum to increase the chances of employment and job opportunities for those graduating students.

Five years have passed since the first batch of students under the K-12 curriculum graduated. In that span of time, most should have graduated from college, are already employed, or have ventured into business by now. Hence, the researchers decided to conduct a tracer study to know how they are doing and if they have achieved their end goal based on the Department of Education's

Calasiao Comprehensive National High School – Senior High School

Humanities and Social Sciences

Calasiao, Pangasinan

mission to help students reach their dreams and provide better output in the country's economic prosperity. The researchers also decided to conduct this study to help assess if the K-12 curriculum helped with their endeavors. It is essential to conduct such a study to recognize if the Senior High School program is effective for whatever curriculum exit students choose right after.

METHODS

This research used a descriptive-correlational design as the researchers are trying to point out the relationship of the variables, in which they surveyed 239 of the first-ever senior high school graduates from Calasiao Comprehensive National High School on their status. The researchers calculated the sample size using Cochran's formulae on a 5% margin of error and selected respondents by a combination of stratified, purposive, convenience, and snowball sampling. Since the study collected all data in one survey, it followed a cross-sectional research model. Using JAMOWI, the researchers then analyzed the frequency and percentage distribution of the respondents in the form of tables and line graphs. They also used the chi-square test to test the null hypotheses and identify relationships between the demographic profile and the respondents' career alignment.

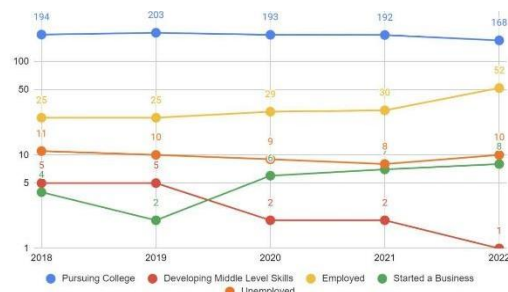

RESULTS AND DISCUSSION

The tables and graphs below present the tabulated data from the respondents with analysis:

Profile	Category	Frequency	Percentage
Age at the time of Graduation	17 below	39	16.3%
	18	155	64.9%
Sex	19 above	45	18.8%
	Male	104	43.5%
Strand Graduated	Female	135	56.5%
	HUMSS	30	12.6%
	STEM	41	17.2%
	TVL-ICT	30	12.6%
	ABM	57	23.8%
	GAS	50	20.6%
	TVL-HIE	31	13.0%
Initial Plan after Graduation	Start Working	32	13.4%
	Pursuing College/Higher Education	202	84.5%
	Develop Middle Skills	5	2.1%
	Unemployed	0	0%
Factors that influenced your choice	Own Choice	128	53.6%
	Family	93	38.9%
	Teacher	4	1.7%
	Career Guidance Orientation	6	2.5%
	Friends	8	3.3%

Table 1. Demographic Profile of the Respondents

As shown in Table 1, in terms of the Demographic Profile of the respondents, most of the respondents graduated at the age of 18 (64.9%), and most of those respondents were female (56.5%). ABM had the highest number of graduates (23.8%). After graduation, most of the respondents chose to continue their education at a higher level, which aligns with the findings of a study by Cabral, Febrer, and Religioso (2022), where they found that 57% of their respondents pursued college. Finally, the majority of the respondents made their decisions based on their desires, wherein career guidance had little to no influence on the respondents' choices (2.5%). Meanwhile, Figure 2

represents a line graph of the career status of the respondents in the last five years.

Fig. 2. Line Graph of Career Status of the Respondents in the Last 5 Years

The graph shows that in those five years, the respondents chose to pursue college instead of the other curriculum exits (79.48%). There was only a decline in the number of respondents in college because of the pandemic in 2020 and possible graduation to a four-year course in 2022. The researchers also saw a slight but gradual increase in the number of employed respondents and respondents who started a business. This may be attributed to the pandemic's effect on online businesses and the respondents acquiring professional licenses, thus becoming professionals in a specific field. This made the number of

Calasiao Comprehensive National High School – Senior High School

Humanities and Social Sciences

Calasiao, Pangasinan

employed respondents increase exponentially in the year 2022. This also agrees with the study conducted by Cabral, Febrer, and Religioso (2022), where they found that most senior high school graduates tend to pursue higher education, followed by seeking employment and starting their businesses. Lastly, the number of unemployed respondents fluctuates; this may be due to the pandemic. However, the number increased again in 2022, suggesting that the respondents needed more time to seek employment or start a business after graduating high school.

Table 2 then presents their college courses in the last five years:

Profile	Category	Frequency	Percentage
ABM	B.S.Accountancy	29	53.70%
	B.S.Business Administration	13	24.07%
	B.S.O.A	6	11.11%
	B.T.L.E	2	3.70%
	B.S.M.A	1	1.85%
	Others	3	5.55%
	Total:	54	100%
GAS	B.S.ED	7	18.42%
	B.S.Criminology	5	13.15%
	B.S.IT	3	7.89%
	B.S.Accountancy	3	7.89%
	B.S.Business Administration	3	7.89%
	Others	17	44.73%
	Total:	38	100%
HUMSS	B.S.ED	13	46.42%
	B.E.ED	3	10.71%
	B.S.Criminology	3	10.71%

	B.S.Psychology	1	3.57%
	Others	6	21.42%
	Total:	28	100%
STEM	B.S.C.E	8	22.85%
	B.S.N	6	17.14%
	B.S.IT	3	8.57%
	B.S.E.F	3	8.57%
	B.S.M.E	2	5.71%
	Others	13	37.14%
	Total:	35	100%
TVL-ICT	B.S.IT	16	69.56%
	B.S.Business Administration	2	8.69%
	B.S.ED	1	4.34%
	B.S.Criminology	1	4.34%
	B.S.H.M	1	4.34%
	Others	2	8.69%
	Total:	23	100%
TVL-HE	B.S.H.M	6	37.5%
	B.S.IT	3	18.75%
	B.S.Business Administration	2	12.5%
	B.S.H.R.M	1	6.25%
	B.E.ED	1	6.25%
	Others	3	18.75%
	Total:	16	100%

Table 2. College Courses Taken by the Respondents in the Last 5 Years

As seen above, respondents from each strand specialize in their specific college courses. This agrees with what Llego (2018) stated about the possible courses each strand can take to align. Only a few respondents had little to no alignment with their strands, graduated, and college courses. However, there was a trend that started in the year 2019,

where some respondents shifted their chosen college courses.

Regarding that, Figure 3 will present the annual shifting of courses by the respondents in the form of a line graph.

Fig. 3. Line Graph of Annual Shifting of Courses by the Respondents

In the said line graph, the shifting only started in the year 2019, and there were only a few respondents shifted annually. The number of shifters maintained a stable percentage, staying below 8% and averaging at 7.69%. Out of all the respondents, the shifters usually came from ABM and GAS, where they usually shifted from Bachelor of Science in Accountancy to Bachelor of Science in Business Administration and Bachelor of Science in Information Technology. Khalid and Rauf (2020) explained that students modify their goals after experiencing more education and experience throughout their university years, particularly in accounting. The respondents may have also shifted due to the inability to handle the pressure and challenge of the course and its learning process.

Meanwhile, Table 3 shows the progress of middle-level skills development in the respondents.

Table 3. Development of Middle-Level Skills Among Respondents in the Last 5 Years

Year	Middle-Level Skills	Frequency	Percentage
2018	Electric Installation and Maintenance	2	40%
	Food and Beverage	1	20%
	Shielded Metal Arc Welding	1	20%
	Food & Beverage	1	20%
	Total:	5	100%
2019	Electric Installation and Maintenance	2	73%
	Shielded Metal Arc Welding	1	25%
	Total:	4	100%
2020	Electric Installation and Maintenance	1	50%
	Shielded Metal Arc Welding	1	50%
	Total:	2	100%
2021	Shielded Metal Arc Welding	1	50%
	Food and Beverage	1	50%
	Total:	2	100%
2022	Food and Beverage	1	100%
	Total:	1	100%

Calasiao Comprehensive National High School – Senior High School

Humanities and Social Sciences

Calasiao, Pangasinan

Table 3 shows the development of middle-level skills among the respondents. In five years, 1.17% of the senior high school alumni chose to develop their middle-level skills and pursue technical vocational courses. This is supported by Miriam College when they said that those courses are only taken for 1-2 years, which makes the respondents have already finished and received their National Certificate (NC).

Table 4 presents the employment status of the respondents in the last five years:

Table 4. Employment Status of the Respondents in the Last 5 Years

Year	Jobs	Frequency	Percentage
2018	Service Crew	4	16.0%
	Sales Clerk	2	8.0%
	Cashier	2	8.0%
	Others	17	68%
	Total:	25	100%
2019	Service Crew	2	8.7%
	Sales Clerk	2	8.7%
	Sales Lady	2	8.7%
	Others	17	73.9%
	Total:	23	100%
2020	Sales Lady	4	13.8%
	Service Crew	3	10.3%
	Cashier	2	6.9%
	Others	20	69%
	Total:	29	100%
2021	Cashier	4	13.3%
	Sales Lady	3	10.0%
	Service Crew	3	10.0%
	Others	20	67.7%
	Total:	30	100%
2022	Teacher	3	5.8%
	Cashier	3	5.8%
	Sales Lady	3	5.8%
	Others	43	82.4%
	Total:	52	100%

As seen in the table, from 2018 until 2021, employed respondents only had part-time jobs such as cashier, saleslady, and service crew. This indicates they only had part-time jobs and got professional jobs after graduating from their four-year course. The low numbers can also be explained by a study conducted by Business World (2021), where employers are hesitant to hire senior high school graduates.

On the other hand, Table 5 presents the business status of the respondents in the

last five years.

Table 5. Business Status of the Respondents in the Last 5 Years

Year	Businesses	Frequency	Percentage
2018	Online Selling	3	75%
	Social Media Manager	1	25%
	Total:	4	100%
2019	Online Selling	2	100%
2020	Online Selling	4	66.7%
	Sari-sari Store	2	33.3%
	Total:	6	100%
2021	Online Selling	4	57.1%
	Sari-sari Store	2	28.6%
	Coffee Shop	1	14.3%
	Total:	7	100%
2022	Sari-sari Store	3	37.5%
	Online Selling	2	25.0%
	Salon	1	12.5%
	Vegetables Distributor	1	12.5%
	Digital Marketing Agency	1	12.5%
	Total:	8	100%

Table 5 shows the various businesses the respondents (2.26%) undertook in the last five years, wherein the value varies. In 2020, an increase in the number of respondents who started a business is seen due to the beginning of the Covid-19 pandemic back in the year 2019, wherein the respondents had to do what they could to support their financial needs. Most of the businesses were online, as per UNCTAD (2021), since the pandemic boosted e-commerce's proportion of global retail trade from 14% in 2019 to 17% in 2020. Only in 2022, when the pandemic subsided, that they started businesses where they could meet their clients face-to-face. There are eight respondents who ventured into business out of 239 respondents (3.34%), a stark contrast to the fact that most graduates of this batch came from ABM.

Figure 4 presents a line graph of the respondents' annual career alignment of curriculum exit.

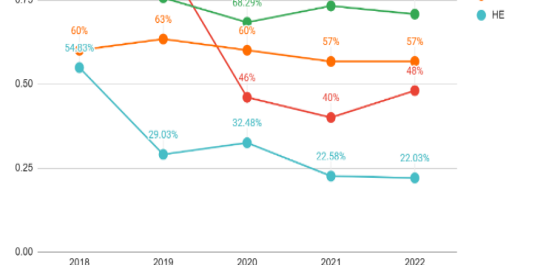

Fig 4. Annual Career Alignment of Curriculum Exit Taken by the Respondents

This line graph presents the annual career alignment of curriculum exit taken by the respondents in the last five years. Of all the strands, GAS and TVL-HE were the most misaligned. This contradicts what Santos and Blas (2019) said, wherein ABM was the most likely to be misaligned.

Meanwhile, Table 6 presents the relationship between the demographic profile of the respondents and their alignment.

Table 6. Correlation Results

Variable	p	Alpha	Decision
Age at the Time of Graduation	0.326	0.05	Not Rejected
Sex	0.542	0.05	Not Rejected
Strand	<0.01	0.05	Rejected
Initial Plan After Graduation	<0.01	0.05	Rejected

Table 6 shows that of all the variables, only strands graduated and initial plan after graduation had a significant relationship to the current career status of the respondents as the p-value is lower than the alpha. This indicates that age and sex do not play a big part in the current career status of the respondents, which contradicts what Cabral, Febrer, and Religioso (2022) said that there is a relationship between the respondents' chosen strands for sex and their curriculum departures. However, there was a significant connection between their sex and strand and their curriculum exit because, as a result, more women than men were discovered to enroll in college as a curriculum departure.

Table 7 is a contingency table that presents the current career alignment to strand graduates of the respondents.

Table 7. Current Career Alignment and Strand Graduated of the Respondents

Strand	Aligned	Not Aligned	Total
ABM	44	12	56
GAS	24	25	49
HUMSS	24	6	30
STEM	29	10	39
TVL-ICT	17	11	28
TVL-HE	9	18	27
Total	147	82	229

As seen in Table 7, most respondents pursued a career aligned with their specialization. The misaligned respondents mostly came from both GAS and TVL-HE. This may have been caused by the lack of opportunities related to their specialization or, in the case of GAS, presented them with too general opportunities. Accountancy, Business, and Management had the highest number of aligned students as they also had the highest number of graduates out of all of the strands, which opposed the study by Santos and Blas et al. (2019) that Accountancy, Business, and Management (ABM) strand students are not aligned with their courses. However, that does not mean that the other strands have a small percentage of aligned graduates; it only means that they have fewer graduates, so the count of aligned graduates would be smaller.

Finally, Table 8 presents the alignment of the current career status and the initial plan of the respondents.

Table 8. Current Career Alignment and Initial Plan of the Respondents

Initial Plan	Aligned	Not Aligned	Total
Work	7	23	30
College	138	56	194

Calasiao Comprehensive National High School – Senior High School
Humanities and Social Sciences
Calasiao, Pangasinan

Middle-Level Skills	2	3	5
Business	0	0	0
Total	147	82	229

Table 8 is also a contingency table that presents the alignment of the current career status and initial plan of the respondents. Of all the variables, respondents who only started working were the most misaligned because they only worked part-time jobs and started getting professional jobs in 2022. Most of the respondents were aligned with some of the variables, such as pursuing college, which had 138 graduates aligned with their current career status. This indicates a significant relationship between the current career status of the respondents and their initial plan after graduation, which agrees with the study conducted by Cabral, Febrer, and Religioso (2022) that the majority of the respondents who are pursuing college are aligned.

CONCLUSIONS & RECOMMENDATIONS

Alums of the Senior High School Program of the Calasiao Comprehensive National High School typically pursued a plan aligned to their graduated strand despite a lack of career guidance influence. However, although there were employment and established businesses right after graduation and over the years, students still opted for higher education. While the Senior High School Program was helpful in college preparation, it does not guarantee immediate readiness for work, which is especially evident in 2022, when despite most college courses requiring four years to complete. Furthermore, Alums of the General Academic Strand, possibly due to lack of specific specialization, which indicates poor career planning, and Alums of Technical Vocational Livelihood – Home Economics,

possibly due to lack of opportunities in the field, were most likely to be misaligned. The same is true for those who worked immediately after graduation, possibly due to a lack of better job opportunities.

The researchers recommend additional studies on the effects of the K-12 program on senior high school students. They may also continue the study and look at the data with a longitudinal approach to provide better insight into the Senior High School Program. Teachers and guidance counselors, together with the school administration, may strengthen career guidance coaching to enhance further the effect it has on the students and further influence them for more awareness and easier decision-making. The Department of Education may consider possible changes to the curriculum or its effective implementation. They should also take an immediate plan of action that focuses on enhancing the program's potency for job opportunities as promised in its implementation. The current administration may also focus on regulating the requirements for job opportunities to support and cater to graduates of the senior high school program.

Abstract - Emotional Intelligence has become a prevalent theme in general and applied psychology and practical business and academic settings for leadership and discovering potential leaders. It has been praised for its capacity to determine job performance and leadership ability. This study helps individuals understand and develop Emotional Intelligence to improve their effectiveness in leadership roles and coping skills. A cross-sectional model was used for the 47 Calasiao Comprehensive National High School SSG officers. The researchers adapted TEIQue-SF by Petrides (2009) as the main instrument, and frequency and percentage distribution were employed in analyzing the data gathered. The scores of the SSG officers were also interpreted based on the factors of Well-being, Self-control, Emotionality, and Sociability. This study shows that there is a low percentage of the respondents that have an "Above Average" score of Emotional Intelligence and a high percentage that have "Below Average" and "Average score of Emotional Intelligence. Implications and recommendations for developing emotional intelligence in students are discussed.

Keywords: Emotional Intelligence, Well-being, Self-Control, Emotionality, Sociability

INTRODUCTION

People lacking Emotional Intelligence typically struggle to comprehend and regulate their emotions, making it difficult to decide what they want, think, and act in certain important situations. To better prepare individuals and their lifestyles, having a thorough understanding of Emotional Intelligence is beneficial.

In view of its ability to recognize thoughts and feelings, inspire oneself, and manage emotions, Emotional Intelligence has become a prevalent theme in psychology, business, and academic settings (Goleman, 1998). In the background, school organization is an important aspect of the country's educational process. The foundation of education is a well-organized

school. School organization enables the achievement of organizational goals and preservation for educational advancement. According to Landry (2019), having Emotional Intelligence is important when leading and serving as one of the bases for global competence (Miladinovic, 2018).

On the other hand, those who lack Emotional Intelligence usually struggle to manage their emotions and cope with life's challenges properly. Managing one's emotions is crucial to preparing oneself and one's lifestyle benefits all students, educators, and other professionals worldwide. The variables examined include Emotional Intelligence and the Calasiao Comprehensive National High School's SSG Officers; this benefits the respondents, SSG

Calasiao Comprehensive National High School – Senior High School

Humanities and Social Sciences

Calasiao, Pangasinan

Officers, the students, and future researchers. Based on the researchers, school SSG officers must act as students' representatives in articulating their opinions, suggestions, and remarks. The SSG officers at the school are the highest governing student body for student involvement, with authority to make recommendations to school authorities on student problems, affairs, and activities. The researchers have chosen SSG Officers as the respondents since they greatly represent student leaders.

Furthermore, students can greatly benefit from emotional intelligence. A high emotional intelligence (EQ) student can communicate more effectively, reduce worry and tension, manage disagreements, enhance relationships, sympathize with others, and conquer life's problems. Individuals with low Emotionality, on the other hand, have difficulty recognizing and communicating their own emotions. As a result, these people have fewer satisfying interactions with others.

Given that Emotional Intelligence is a necessary quality, and a high level of Emotional Intelligence helps individuals build relationships, reduce team stress, defuse conflict, and improve performance satisfaction, Emotional Intelligence ultimately allows a person or oneself to examine their own and other's behavior in order to comprehend and adopt necessary abilities. Being emotionally intelligent allows one to avoid making rash decisions and to consider the immediate and long-term consequences of their choices. Emotional Intelligence is said to influence practical leadership and performance qualities in humans. More importantly, by understanding their Emotional Intelligence, this research may help them develop their coping skills.

METHODS

The researchers utilized a descriptive research design, a non-experimental design. The study also follows a cross-sectional

model, in which they analyzed data collected at a single point in time (Thomas, 2020), focused on describing the emotional intelligence of all Calasiao Comprehensive National High School Supreme Student Government Officers.

The researchers measured the emotional intelligence of the respondents using TEIQue by Petrides (2009), which composed of fifteen facets that were derived from a comprehensive content analysis of prominent EI literature: adaptability, assertiveness, emotion appraisal (self and others), emotion expression, emotion management (others), emotion regulation, impulsiveness (low), relationship skills, self-esteem, self-motivation, social competence, stress management, trait empathy, trait happiness, and trait optimism.

The adapted 30-item questionnaire was divided into four sections. Numbers 5,9,12,20,24,27 are parts of well-being; numbers 4,7,15,19,22,30 are self-control; numbers 1,2,8,13,16,17,23,28 are Emotionality; numbers 6,10,11,21,25,26 are Sociability; and numbers 3,14,18,29 are global emotional intelligence. The researchers analyzed the data quantitatively using frequency and percentage distributions for the data collected. They interpreted the scores of the SSG officers based on the percentile rank of their scores on the said factors, interpreting as 1–30 scores are "Below Average," 31–70 scores are "Average," and 71–100 scores are "Above Average."

RESULTS AND DISCUSSIONS

Table 1 summarizes the emotional intelligence profile of the officers:

Table 1. CCNHS SSG EQ Profile

CRITERIA	CATEGORY	FREQUENCY	PERCENTAGE
Well-Being	Above Average	12	25.53%
	Average	20	42.55%
	Below Average	15	31.91%
Self-Control	Above Average	14	29.79%
	Average	14	29.79%
	Below Average	19	40.43%
Emotionality	Above Average	11	23.40%
	Average	21	44.68%
	Below Average	15	31.91%
Sociability	Above Average	12	25.53%
	Average	18	38.30%
	Below Average	17	36.17%
Global Trait EI	Above Average	12	25.53%
	Average	11	23.40%
	Below Average	24	51.06%

Calasiao Comprehensive National High School – Senior High School
Humanities and Social Sciences
Calasiao, Pangasinan

The Well-Being factor has three facets: happiness, optimism, and self-esteem. The data above shows that the white majority has an Average level of Emotional Intelligence on the Well-Being factor (42.55%). According to Petrides (2021), individuals who show up with Above Average high scores feel positive, happy, and fulfilled. In contrast, individuals with low scores tend to have low self-regard and to be disappointed in their lives as they are at present. With that being stated, there is still a need to improve the SSG Officer's Well-Being.

The second factor in Emotional Intelligence is Self-Control, which comprises the facets of emotion regulation, impulsiveness, and stress management. Table 1 shows that most of the respondents have below-average self-control (40.43%), indicating that improvement in this factor is much needed. This factor explains why high scorers have a healthy degree of control over their urges and desires. In addition to fending off impulses, they are good at regulating external pressures and stress. They are neither repressed nor overly expressive. In contrast, low scorers are prone to impulsive behavior and seem incapable of managing stress. Low self-control is associated with inflexibility.

Following this, Emotionality consists of empathy, emotional expression, emotional perception, and relationships with others. Emotionality has "Average" having the highest distribution with 21 students (44.68%), then "Below Average" with 15 students (31.91%), and "Above Average" having the lowest percentage, 11 students (24.40%). The majority has an "Average" and "Below-Average" level of Emotional Intelligence on this factor. Individuals with high scores on this factor believe they have many emotion-related skills. In contrast, individuals with low scores find it difficult to recognize their internal emotional states and express their feelings to others, often leading

to less rewarding personal relationships. Sociability has three facets: emotion management, assertiveness, and social awareness. The "Average" has the highest distribution with 18 students (38.30%), while "Below Average" has 17 students (36.17%), and the "Average" stands as the least among the percentage distribution with 12 students (25.53%). The majority have an "Average" and "Below-Average" level of Emotional Intelligence, which indicates a much-needed improvement in their Sociability. As stated by Petrides (2021), individuals with above average and average have good listening skills and can communicate clearly and confidently with people from diverse backgrounds. Those with low scores believe they cannot affect others' emotions and are less likely to be good negotiators or networkers.

Lastly, Global Trait EI has the facets for Global: adaptability and self-motivation. The legend "Below Average" has the highest among all the distributions, with 24 students (51.06%), while "Above Average" has 12 students (25.53%) and 11 students (23.40%) for the "Average." The majority has a "Below Average" level of Emotional Intelligence, a great indicator of a much-needed improvement in the Global Emotional Intelligence Trait factor. In addition, Petrides (2021) stated that if you scored high, you are more likely than most to experience difficulties in a social context, to overreact in situations that you find unpleasant, and to undergo bouts of worry, gloom, and unease. Meanwhile, it is important to remember that a low global trait EI score has advantages. Substantial evidence shows that Emotional Intelligence is essential in improving performance (Karimi, 2021). It is one of the factors that contribute to our leadership effectiveness. Only 22% of 155,000 leaders have critical Emotional Intelligence, according to May (2022), and this refers to the personal characteristics and traits. Effective Leadership is essential for today's

Calasiao Comprehensive National High School – Senior High School
Humanities and Social Sciences
Calasiao, Pangasinan

firm. People argue that Emotional Intelligence is the requirement for Effective Leadership. On the other hand, students who lack Emotional Intelligence may become less attached to the school/college and hence feel deserted or lonely, impacting their classroom performance (Yadav, 2022).

CONCLUSION & RECOMMENDATION

The SSG Officers typically possess average to below average emotional intelligence, signifying that personal development training will be necessary to hone their emotional intelligence in all criteria, especially on Self-Control and Global Emotional Intelligence Traits. The researchers prepared a plan of action to improve the well-being, self-control, Emotionality, Sociability, and global emotional intelligence of SSG officers to help them develop their Emotional Intelligence.

Providing the preceding findings, the researchers have made the following recommendations. The researchers recommend that the school and the organization implement additional programs for raising awareness and developing one's Emotional Intelligence even in the next school year.

Further studies may still be conducted to determine the other more important factors that may help acquire a higher level of Emotional Intelligence.

BODY IMAGE PERCEPTION OF SEXES AND THEIR LIKELIHOOD TO BODY DYSMORPHIA

Gethsamaine P. Dela Cruz, Aliyah Nicole M. Joves, Jenilyn F. Muñoz, Caryll Dave D. Joves, and Mariella T. Vallo

Genesis S. Parel, MAEd
Research Adviser

Abstract - Body image has arisen as an essential societal concern, with individuals seeking to fulfill unreasonable ideals and participating in comparisons with others. These concerns can harm how people perceive, feel, think, and behave in connection to their bodies. This study explored and compared the self-body image opinions of Senior High School students based on sex. The researchers used an ex post facto design and cross-sectional model to determine the impacts of a poor self-body image on male and female senior high school students. They also used a Physical Appearance Comparison Scale-Revised questionnaire and Cochran's Formulae to collect data from 321 out of 1,959 Senior High School students at Calasiao Comprehensive National High School. In both sexes, 32.09% of the sample appear to be likely diagnosed with body dysmorphic disorder (BDD). No statistically significant differences across sexes were observed in the results ($p=0.81>0.05$). Access to counseling and support services, such as school counselors or mental health specialists, can provide direction and aid to people with negative views of themselves and should be prioritized to lessen the number of students diagnosed with body dysmorphic disorder.

Keywords: Body Image, Sex, Students, Body Dysmorphic Disorder

INTRODUCTION

Body image has become one of the societal challenges since society has made people obsessed with fitting into one's image, and it is difficult to avoid comparing oneself to these unrealistic ideals. Other people do not care about the influence of their criticism on someone's physical appearance, which affects how others view, feel, think, and perceive themselves. These also impact how one regulates weight, self-esteem, eating habits, and mental health, which can lead to

body dysmorphia.

According to McShirley (2015), a person's perceptual body image—is how one perceives themselves—ffective body image—is how one feels about their body—mental body image—is how one thinks about their body—and behavioral body image—is how an individual act toward their bodies—are all factors that affect how they perceive themselves. Positive body image entails embracing and loving one's looks. In contrast, negative body image entails

unrealistic beliefs and unhappiness with one's body, leading to difficulties such as disordered eating and mental health disorders. Furthermore, Linardon's (2019) research includes body image data for male and female teenagers. Around 17% of Australian children and adolescents were unsatisfied with their bodies, and 5% overvalued their weight/shape. Approximately 50% of 13-year-old American girls were dissatisfied with their bodies, a rising figure.

Body image is influenced by media exposure to idealized body ideals, according to the Mental Health Foundation (2022). Internalizing these ideas might result in bad feelings about one's looks and harmful eating habits. Young individuals have indicated that celebrities and TV shows make them self-conscious about their bodies. Moreover, negative body image can also lead to body dysmorphic disorder (BDD), which affects both males and girls. BDD is distinguished by obsessive attention to perceived flaws or defects in appearance, which leads to compulsive behaviors and the pursuit of cosmetic operations (Mayo Clinic, 2022). Women are more interested in leg looks, while males are more concerned with muscularity and body structure.

Hence, this study aimed to compare the self-body image perceptions of Senior High School students based on sex. The study addressed three particular questions, including the sample students' perception of the self-body image across sexes, which sex is more prone to body dysmorphia, and if there is a statistically significant difference in the self-body image perception between males and females. The study's objectives include giving insights into students' self-perceptions of their bodies and providing light on potential gender variations in body dysmorphia and self-body image perception.

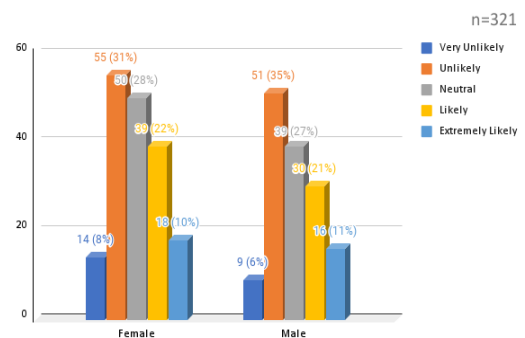

METHODS

The researchers utilized an ex post facto design and cross-sectional model since the researchers would gather data from a small sample of people at a particular moment. Furthermore, the questionnaire contains a demographic profile of sex and the adopted questionnaire, the Physical Appearance Comparison Scale-Revised questionnaire established by Schaefer and Thompson (2014). As a result, the researchers anticipate receiving more accurate and higher quality data since participants will not be distracted by online material and can focus on thoroughly reading and answering each question.

The researcher's respondents in this study are 321 out of the 1,959 Senior High School students at Calasiao Comprehensive National High School, according to calculations made utilizing Cochran's Formula, Stratified Sampling, and Convenience Sampling. The researchers employed statistical tools, including frequency and percentage, and the Independent Sample T-test to assess the information collected from the respondents.

RESULTS AND DISCUSSION

Data was studied, and questionnaires were delivered to determine the questions about the self-body image perception across

the sexes.

Figure 2. Self-Body Image Perception of Respondents Across Sexes

With the interpretation of PACS-R, the majority of respondents scored Unlikely (33%). The lowest is Very Unlikely (7%) in comparing themselves to others, which indicates that the majority have a positive body image. As stated by Tylka & Wood-Barcalow (2015), positive body image is the acceptance of, respect for, and favorable judgments about one's body despite differences from media-promoted ideals of physical attractiveness. Scores with Unlikely interpretations suggest intense levels of acceptance and self-confidence, which would make them less likely to engage in social comparisons based on looks. However, Body Dysmorphic Disorder still occurs since 103 (32%) individuals, 57 female, and 46 male respondents, appear to be diagnosed with Body Dysmorphic Disorder (BDD).

The researchers interpret the result using the independent sample t-test.

Table 2. Independent sample t-test results

t	p-value	alpha	Decision
0.24	0.81	0.05	Not Rejected

Table 2 presents results that fail to reject the null hypothesis, as indicated by the values ($0.24 > 0.027$, $0.81 > 0.05$). The t statistic derived from the data suggests a small effect size, and the p-value surpasses the predetermined alpha or significance level. There is no statistically significant difference in the perception of the self-body image between male and female Senior High School students at Calasiao Comprehensive National High School. Both sexes exhibit a similar level of self-comparison within their respective sexes. These suggest that while males and females do not typically experience significant insecurity regarding their self-body image, which is beneficial as it reduces their susceptibility to body dysmorphia or Body Dysmorphic Disorder (BDD), its existence in the population is still prevalent.

CONCLUSION & RECOMMENDATION

While it is true that most of the male and female respondents report having a positive body image, Body Dysmorphic Disorder (BDD) still exists in the population, regardless of sex. There is still a need for further efforts to address this issue. School principals are crucial in promoting body positivity and preventing the harmful practice of comparing oneself to others. To accomplish these goals, instructional programs and public awareness campaigns should be established in schools. These initiatives should educate students about the detrimental effects of body comparisons and emphasize the importance of self-acceptance and challenging societal beauty standards.

Future researchers may also delve into the factors that influence the opposite sex's perception of their body image and the subsequent impact on their mental health. By conducting thorough research in this area, it is possible to develop more targeted treatments and strategies to address issues effectively.

MULTIPLE INTELLIGENCE AND ACADEMIC MOTIVATION AMONG SENIOR HIGH SCHOOL STUDENTS IN CALASIAO COMPREHENSIVE NATIONAL HIGH SCHOOL

Charmaine Rose B. Bermas, Roniel R. Sangumay, Rixlen Montemayor Gregorio, Stephanie B. Uranza, Mc Kennedy R. Castro, Zarex Andree G. Calimlim, and Frenzy Mae Sofia D. Torres

*Genesis S. Parel, MAEd
Research Adviser*

Abstract - The rate of enrollment and dropout in the Philippines has been one of the problems not just in the education system but all over the country and the world. Some students said that it is due to the contents or lesson having little value. This study identified if the Multiple Intelligence of the students affects the Academic Motivation of the students. The researchers employed a descriptive correlation design to collect data from Senior High School Students in Calasiao Comprehensive National High School with regards to their age, sex, and strand as well. The researchers adopted two Instruments in Multiple Intelligence Survey and Academic Motivation scales. The study concluded that the students' Multiple Intelligence does not correlate with the Academic Motivation of the students. Future researchers should investigate Multiple Intelligence and Academic Motivations separately to gather new information and identify what causes students to lose interest in their studies.

Keywords: *Multiple Intelligence, Academic Motivation, Senior High School Students*

INTRODUCTION

It is well-known in the education sector — not just in the Philippines but worldwide — that there are, until now,

students dropping out of school due lack of interest or motivation (Vipat, 2022). It may be because students see little to no value in the course or the contents of the study itself

(Carnegie Mellon University). According to Robertson (2018), students who did not finish high school tend to find it more challenging to search for jobs than those who have graduated. The awareness of multiple intelligence allowed the students to assess their strengths. Also, it enabled the teachers to understand and know what strategic plans they can employ to instruct the students effectively. One of the objectives of this study is to identify if multiple intelligence affects the academic motivation of senior high school students. The study aimed to determine the relationship between multiple intelligences and academic motivation among senior high school students. It also aimed to create an awareness regarding the existence of multiple intelligences proposed by Howard Gardner and make the students understand that they should not be comparing themselves to others as they have a different multiple intelligence profile than other students. Students' academic motivation was analyzed and tabulated with multiple intelligence to see if it depends on the multiple intelligences used in schools, classrooms, or simply by themselves.

METHODS

The researchers employed a descriptive-correlational design to describe the relationship between senior high school students' multiple intelligence and academic motivations. To gather the needed data, they used stratified sampling to collect the required sample to represent the population. Furthermore, the researchers adapted the Multiple Intelligence Survey created by Walter McKenzie (1999-2017) and Academic Motivation Scale by Vallerand (1983). It allowed the researchers to gather data on their species variables, namely Multiple Intelligence and Academic Motivation. The researchers also asked for an instrument validation and reliability check due to the changes they have made for a

better interpretation of the variables and results. The researchers analyzed the data by gathering the mean of both variables with the help of PivotTable of Microsoft Excel to gather the results based on the demographic profile of the Senior High School students. The researchers identified the relationship with the use of the Chi-Square test and P-value test to see if there is a significant relationship between the two variables.

RESULTS AND DISCUSSION

Table 1. The Intelligence Domain of Senior high school students

n = 321		
Intelligence Domain	frequency (f)	percentage (%)
Analytical	70	21.80%
Interactive	54	16.82%
Introspective	133	41.43%
Analytical and Interactive	12	3.738%
Analytical and Introspective	12	3.738%
Interactive and Introspective	16	4.98%
All	24	7.47%

Table 1 showed that most students fall into Introspective Domain, which indicated that most students relate their emotions and experience to learn effectively. Cherry (2023) states that introspective people examine their thoughts, feelings, judgments, and perceptions. Introspective behavior is characterized by self-observation that leans toward greater self-awareness. Self-awareness gives individuals an understanding of themselves, enabling them to adjust, create improvements, and accommodate their weaknesses (Steiner, 2014).

Table 2. The Academic Motivation Senior high school students

Calasiao Comprehensive National High School – Senior High School
Humanities and Social Sciences
Calasiao, Pangasinan

n = 321		
Intelligence Domain	frequency (f)	percentage (%)
Intrinsic	1	0.311%
Extrinsic	3	0.93%
Amotivation	1	0.311%
Intrinsic and Extrinsic	80	24.92%
Intrinsic and Amotivation	8	2.492%
Extrinsic and Amotivation	8	2.492%
All	216	67.29%

Table 2 indicated that most students experience all types of academic motivation. It means that they may still feel academic motivation while they are all intrinsically and extrinsically motivated. It may be the result of students not being to see the value of studying, the teaching method used by the teachers being deemed boring by the students, subjects being either too challenging or too easy, or the uncomfortable learning environment that disables a student to maximize their abilities (Silva, 2019), which according to Skedel (2021) could lead to stress, burnouts, or boredom.

Table 3. Chi-square test results between Multiple Intelligence and Academic Motivation of the respondents.

n = 321				
χ^2	p-value	alpha	Critical Value	Decision
36.36427	0.1760	0.05	62.83	Do not reject the null hypotheses

As seen in Table 3, the null hypothesis (H_0), which claimed that Multiple Intelligence and Academic Motivation among Senior High School Students did not have a statistically significant relationship, is thus not rejected. While the students' academic motivation plays an essential role

in their performance, several factors include class structure, teacher behavior, teaching methods, and parental involvement (Silva, 2020). It only confirms that any intelligence does not necessarily affect their motivation to study. Regardless of their intelligence and diversity, students can still experience amotivation even though they typically have intrinsic and extrinsic motivation.

CONCLUSION & RECOMMENDATION

To conclude, there is no significant relationship between Multiple Intelligence and Academic Motivation in Senior High School Students. This study found that multiple intelligence did not affect the academic motivation of Calasiao Comprehensive National High School senior high school students. Students may feel or have diverse academic motivations regardless of their multiple intelligences.

The following are the researchers' recommendations in response to the concerns in Chapter 1 on the significance of the study.

1. It was highly recommended that students are aware of the theory proposed by Howard Gardner — Multiple Intelligence Theory — to empower students regarding their intelligence. It will allow students to perform better if they know their strengths and weaknesses, allowing them to produce their ways of dealing with problems from new perspectives.

2. Teachers must be aware of the diversity of students, especially their intelligence, to produce a better lesson plan to promote inclusivity between different students and instruct the students effectively and to their ability. Promoting inclusivity inside classrooms will create a better learning environment for teachers and students.

Calasiao Comprehensive National High School – Senior High School
Humanities and Social Sciences
Calasiao, Pangasinan

[intrinsic-motivation-2795384](#)

3. Researchers of this study strongly recommend future researchers conduct studies that will further describe the multiple intelligences of the students in the entire campus to understand the diversity between students further and to help the students understand their strengths and weaknesses that will be beneficial in attaining a better academic performance. Furthermore, the researchers advise future researchers to correlate multiple intelligence to variables that will maximize the students' multiple intelligences and create a better understanding of different bits of intelligence and their distinct characteristics.

4. The education sector should focus on creating a better learning environment that encompasses inclusivity, especially on foreign intelligence, to allow students to study effectively, which would result in a better future for the students and the nation as a whole. Additionally, the education sector should be aware of the different types of intelligence of the students to understand the students themselves and solutions to problems concerning students failing schools and education.

ACADEMIC-RELATED PROBLEMS ENCOUNTERED BY SENIOR HIGH SCHOOL STUDENTS DURING THE IN- PERSON CLASSES: BASIS FOR PLAN OF ACTION FOR PSYCHOSOCIAL SUPPORT ACTIVITIES

Nariquil Ann D. Liquiran, Cassandra Jhayne S. Padua, and Kim Kristin Julia E. Zara

Genesis S. Parel, MAEd
Research Adviser

Abstract – *The COVID-19 pandemic has changed how students learn and interact. This study aims to provide a better understanding of the challenges faced by Senior High School Students during in-person classes to create a plan of action for psychosocial support activities to help them cope better. In this quantitative study, the researchers surveyed 322 Senior High School Students of Calasiao Comprehensive National High School. When faced with problems at school, most students seek help from their peers/friends and classmates rather than their families. While they face various academic-related problems, overwhelming schoolwork is the most prevalent. Although the extent of their coping strategies is moderately evident, they can still further improve. The researchers successfully developed an action plan based on these findings.*

Keywords: *Academic-related problems, psychosocial support activities*

INTRODUCTION

The COVID-19 pandemic has changed the way students learn and interact. Students were forced to transition from in-person to distance learning, which presented many difficulties, including a lack of access to digital resources, technical difficulties with online learning systems, and difficulty understanding and keeping up with lessons. Despite the difficulties, Malipot (2022) stated that the Department of Education could resume full in-person classes in public schools across the Philippines as students struggle to transition to the post-COVID world and learn in person again.

Furthermore, research conducted by Malolos et al. (2021) found that most students are still experiencing psychological distress due to the pandemic. The pandemic has had a major influence on students' mental health and has contributed to academic-related concerns. In addition, according to

Llego (2022), the Department of Education has instructed schools to implement psychosocial support activities when classes begin. These activities serve as first aid in supporting students in managing their emotions and building positive coping strategies to manage their problems in their current school environment and life in general.

Given the pandemic's impact on student's academic lives, the researchers conducted the Academic-Related Problems Encountered by Senior High School Students During In-Person Classes. It will evaluate how senior high school students solve their academic-related problems in different ways. This study aims to provide a better understanding of the problems that Senior High School Students have during in-person classes, as well as to provide possible solutions or psychosocial support activities that can be implemented to assist them in

coping better with their academic concerns.

METHODS

This quantitative study used a descriptive research design to determine academic-related problems senior high school students encountered during in-person classes. A total of 322 senior high school students out of the 1959 students enrolled at Calasiao Comprehensive National High School for the School Year 2022 - 2023 were selected as respondents of this study. The researchers used stratified random sampling and the Cochran's formulae to calculate the sample size with a margin of error of 5%. A questionnaire and web questionnaire were used to collect data for this quantitative research.

The most important details in this study were the results of a descriptive statistical technique used to analyze the academic-related problems senior high school students encountered during in-person classes. The data is analyzed using descriptive statistical techniques such as frequency, percentage, and mean. If the respondents' responses scored 4.21 to 5.00, the different strategies to overcome academic-related problems used by the respondents were very evident. If the mean scores range from 3.41 to 4.20, the different strategies to overcome academic-related problems used by the respondents were evident. If the mean scores range from 2.61 to 3.40, the different strategies to overcome academic-related problems used by the respondents were moderately evident. If the mean scores range from 1.81 to 2.60, this indicates that the different strategies to overcome academic-related problems used by the respondents were less evident. Finally, if the mean scores range from 1.00 to 1.80, the different strategies to overcome academic-related problems used by the respondents were not evident.

RESULTS AND DISCUSSION

The figure below shows the support systems to which the respondents seek help whenever they have difficulties at school.

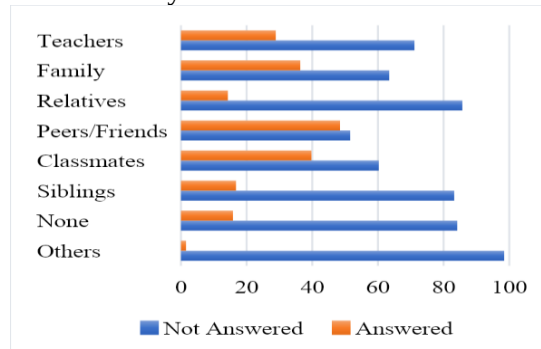

Figure 1. Support Systems of Senior High School Students (n=322)

As seen in Figure 1, the respondents usually seek help from their peers/friends, with 48.45%. Followed by classmates in a close second with 39.75% of the respondents seeking help from them, then a family came in third with 36.34%. Lastly, 1.55% of the respondents least frequently seek help from others.

As mentioned by Guo (2014), the reasons why teens may be more likely to seek help from their peers or friends than their family may vary. Generally, teens may feel more comfortable talking to their peers since they are around the same age and may have had similar experiences. They may also feel that their peers can relate to their concerns more than their family since they can more easily relate and understand each other's feelings. Knudsen (2017) also stated that peers/friends might be less judgmental and more understanding of the teen's situation, allowing them to discuss their thoughts and feelings without fear of judgment more openly. Peers/friends are seen as a more neutral, safe source of support and advice, which teens may not feel they can get from their families.

Meanwhile, the figure below shows the academic-related problems encountered

Calasiao Comprehensive National High School – Senior High School
Humanities and Social Sciences
Calasiao, Pangasinan

by the respondents during the in-person classes.

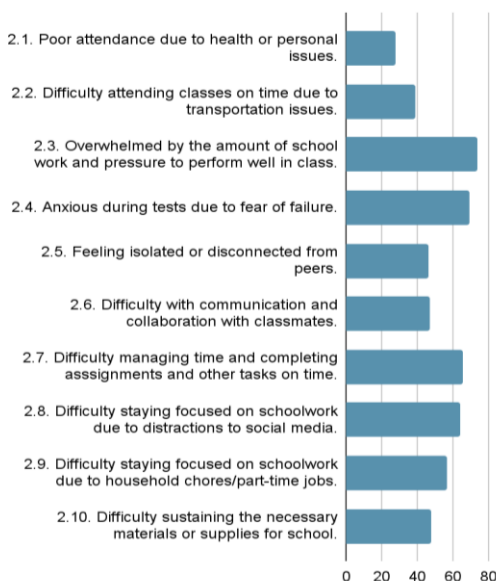

Figure 2. Academic-Related Problems Encountered by Senior High School Students

As seen in Figure 2, the most common problem that Senior High School Students encounter are related to feeling 'Overwhelmed by the amount of school work and pressure to perform well in class' (73.60%), 'Anxious during tests due to fear or failure' (68.94), and 'Difficulty managing time and completing assignments (65.84). The least common problem encountered by Senior High School Students is 'Poor attendance due to health or personal issues (27.95%).

Barbayannis et al. (2022) mention that the primary causes of academic problems for students include the need to balance academic and personal responsibilities. Students may struggle to manage their academic responsibilities and feel overwhelmed by their workload, leading to a greater tendency to be distracted by the Internet and Facebook (Shihui et al., 2019). Moreover, Deng et al. (2022) stated that students experienced academic standards,

which added pressure, making them struggle to balance their schoolwork with other activities leading to difficulty managing their time. Students who are often expected to perform well in class and on tests can cause anxiety due to fear of failure leading to poorer academic performance.

Meanwhile, Table 1 below shows the different strategies Senior High School Students use to overcome their academic-related problems during in-person classes:

Table 1. Strategies to Overcome Academic-Related Problems (n=322)

Indicators	WM	DE
3.1. Seek out extra help from teachers.	3.06	ME
3.2. Talk to school counselors for advice on managing workloads and stress.	2.60	ME
3.3. Reach out to family and friends for assistance.	3.54	ME
3.4. Create a study plan.	3.48	E
3.5. Get involved in activities that are meaningful and enjoyable.	3.69	E
3.6. Establish a regular sleep and waking-up schedule to catch up with the class on time.	3.43	E
3.7. Engage in peer coaching activities to help ease the difficulties of school tasks.	3.20	ME
3.8. Limit online games and social media use unrelated to school tasks.	3.30	ME
3.9. Develop effective study habits, such as taking notes in class and avoiding procrastination.	3.72	E
3.10. Budgeting and spending allowance wisely.	3.67	E
Weighted Mean	3.37	ME

Note: WM=Weighted Mean, DE=Descriptive Equivalent
 Legend: 1.00-1.80 (NE-Not Evident); 1.81-2.60 (LE-Less Evident); 2.61-3.40 (ME-Moderately Evident); 3.41-4.21(E-Evident); 4.21-5.00 (VE-Very Evident)

Table 1 shows that strategies to overcome academic-related problems are moderately evident in Senior High School Students. The most evident strategies that were observed were developing effective study habits, with a mean score of 3.72, followed by getting involved in meaningful and enjoyable activities, with a mean score of 3.69. However, the strategies of seeking extra help from teachers, with a mean score of 3.06, and talking to school counselors for

Calasiao Comprehensive National High School – Senior High School
Humanities and Social Sciences
Calasiao, Pangasinan

advice on managing workloads and stress, with a mean score of 2.60, were only moderately evident.

The American Psychological Association (2016) found that students struggling academically often do not seek help from teachers or school counselors. The study found that while some students find talking to teachers or school counselors helpful, many students seek advice from peers or family members instead. This may be due to a lack of trust in adults or a fear of appearing "stupid" in front of teachers or school counselors. As a result, many students relied on their problem-solving strategies, which often proved ineffective. Students often fail to seek extra academic help from teachers or school counselors due to fear of being judged. Lastly, the study found that students often avoid seeking help due to feelings of shame or embarrassment or the belief that seeking help is a sign of weakness.

CONCLUSION & RECOMMENDATION

The researchers concluded that most Calasiao Comprehensive National High School senior high school students identified their peers/friends and classmates as their primary support system when facing difficulties in school. The academic-related problems encountered during the in-person classes were mostly the overwhelming amount of schoolwork and being anxious about taking tests due to fear of failure.

Meanwhile, the extent of the respondents' use of strategies to overcome these academic-related problems is moderately evident. There are still ways to improve these strategies. Therefore, the researchers developed an action plan for psychosocial support activities, such as teachers participating in psychosocial support training. Seminars, counseling, and other activities must involve parents and family members. School clubs, counselors, and advisory classes can participate in the

implementation of extracurricular activities.

Lastly, further studies may still be conducted on the learning styles and methods of the students to serve as the basis for having more effective teaching methods in educational facilities.

ENHANCING THE AWARENESS OF TEENAGE PREGNANCY AMONG GRADE 11 LEARNERS OF CALASIAO COMPREHENSIVE NATIONAL HIGH SCHOOL BY SOLACE PROGRAM

*Airah B. Catabay, Mia Margau G. Dioma, Bea Antonette T. Estrada,
Veronica D. Dela Cruz, and Rj M. Dollesin*

*Genesis S. Parel, MAEd
Research Adviser*

Abstract - Teenage pregnancy is one of the world's major issues, caused by early relationships, anger, violence, and curiosity. The objective of the study was to test the Effectiveness of the Solace Program in Enhancing the Awareness of Grade 11 Learners about Teenage Pregnancy. This quantitative study was based on action research with a quasi-experimental research design. Specifically, the researchers used a quasi-one-group pretest–posttest design. Furthermore, the respondents were Grade 11 learners at Calasiao Comprehensive National High School at Malong Street, Poblacion West, Calasiao, Pangasinan. The pretest-posttest assessment was used before and after the program. Furthermore, the program had a debate, a lecture, and visual aids. The researchers then used a comparative analysis, including a paired t-test, to analyze the collected data and got a p -value of 0.01, signifying that the Solace Program successfully increased the level of awareness among the learners. Although it significantly impacted learners' awareness of teenage pregnancy, it still requires further improvement to achieve a passing score of 75% out of 100%. This program could educate people about teen pregnancy in other settings.

Keywords: Teenage Pregnancy, Sex Education, Teenage Pregnancy Prevention Program

INTRODUCTION

One of the current issues in the world is teenage pregnancy. Wagle (2019) states that a young person's early relationships, race, sexual aggression, inability to get contraceptives, and insatiable curiosity are key factors in teenage pregnancy. Teenage pregnancies are also linked to poor access to sexual health and education programs. Children who use mobile devices like smartphones, computers, and tablets risk becoming addicted to Facebook, online dating services, Instagram, and other social networking sites. According to Gaille (2016), teen pregnancy would expand the population, inevitably resulting in poverty. The reason

some parents are unable to provide for their own families' needs, some are unable to attend school, and others find it challenging to get employment since they are not graduate students due to the unfathomably large number of people living in a given location. Furthermore, according to Xinhua (2023), teenage pregnancy among girls aged 15 to 19 in the Philippines declined to 5.4 percent in 2022 from 8.6 percent in 2017, based on the data released by the Philippine Statistics Authority.

The researchers decided to conduct a study on enhancing the awareness of teenage pregnancy among Grade 11 Learners by developing a program that addresses this

concern. In order to lower the rate of teenage pregnancy, the program seeks to encourage healthy decision-making and to provide comprehensive and age-appropriate sex education.

Hence, the study was to test the Effectiveness of the Solace Program in enhancing the awareness of Grade 11 learners on Teenage Pregnancy. Specifically, the researchers utilized pretest and posttest assessments to determine the effectiveness of the Solace Program.

METHODS

This quantitative study was based on action research with a quasi-experimental research design. The researchers used a quasi-one-group pre-test-post-test design because it was the most appropriate for studies involving a single group of participants. The design allowed the researchers to measure the program's effects on the same participant groups before and after the program. This study's data utilized a pretest and posttest assessment. The pretest and posttest assessments evaluated various topics, such as the causes, consequences, and teenage pregnancy prevention. The pretest was given before the intervention, and the posttest followed. The respondents came from Grade 11 students at Calasiao Comprehensive National High School, located at Malong Street, Poblacion West, Calasiao, Pangasinan. Of the total population of 1073 Grade 11 learners, 101 came from different strands only. They then compared the mean scores of the tests to measure changes in the subjects' understanding of teenage pregnancy using paired t-test.

RESULTS AND DISCUSSION

The researchers conducted a pretest with Calasiao Comprehensive National High School students in Grade 11 to measure their prior knowledge about teenage pregnancy. After conducting the pretest, the researchers implemented the Solace Program, which

involved lessons, debates, and discussions about teenage pregnancy's causes, effects, and prevention. After the Solace program was over, the researchers gave the Grade 11 learners a posttest to measure their level of awareness and determine the program's success. For an easier understanding of their scores, the researchers then converted the score into a percentage.

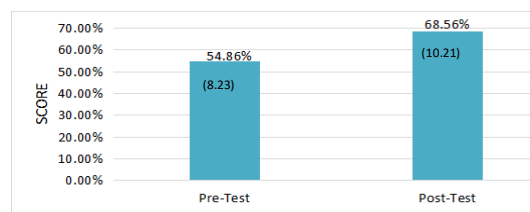

Figure 1. Pretest and Posttest Results

According to the pretest data, the average degree of knowledge concerning teen pregnancy among the students was 54.86%, considered poor. Maxwell et al. (2016) have shown that a high level of awareness has played a role in alerting teenagers to the preventive measures for teenage pregnancy. Therefore, it seems the learners' understanding of teenage pregnancy is insufficient. These views indicate that most Grade 11 learners are unaware of the causes, consequences, and prevention of teenage pregnancy. Furthermore, the average score of 68.56% in the posttest suggests an improvement in awareness. Even though this was an improvement, the posttest score was still below 100%, according to the researchers, showing that there is room for growth and that teens still need more knowledge regarding teenage pregnancy.

Meanwhile, the findings of the paired t-test further supported the comparison the researchers presented in the previous discussion, as seen below:

Calasiao Comprehensive National High School – Senior High School
Humanities and Social Sciences
Calasiao, Pangasinan

t	Critical Value	df	p	Decision
-6.76	1.98	99	<0.01	Reject the null hypothesis

Table 1. Paired Sample T-test Results Comparing the Pretest and Posttest Scores

As seen in Table 1, the Solace Program effectively enhanced students' awareness level in Grade 11, as evidenced by the p-value's significant level of 0.01. The null hypothesis (H0) that there was no statistically significant change between the level of awareness before and after the program has been rejected. The program gave learners the knowledge and resources they needed to make responsible decisions concerning their reproductive health and created a secure and encouraging environment where individuals could freely express their concerns and questions. This suggested that the program was successful.

CONCLUSION & RECOMMENDATION

In a population with initially low awareness of teenage pregnancy, it was evident that the Solace Program has significantly enhanced the awareness among Grade 11 learners at Calasiao Comprehensive National High School. However, the program can improve to gain a passing score among its target population. The findings proved that this program could be effectively implemented in other settings to increase awareness of teenage pregnancy and its associated issues. The Solace Program had a positive effect on the students' awareness. It can be done because, through fun learning, information can be understood and maintained well. The description above implies that the debates can help them learn better. They are introduced to different perceptions and can build their logical thinking. The researchers' recommendations include taking advantage of the Solace Program and its resources to become more informed and aware of teenage pregnancy.

Teachers at Calasiao Comprehensive National High School should also offer comprehensive sex education and encourage students to engage in programs about teenage pregnancy. Furthermore, for the following Grade 12 learners who will continue the Solace Program, the researchers' advice is to plan, prepare for success, and have the Grade 7 to Grade 12 as audiences for the Solace Program. The most important details are that the school should establish prevention programs to educate students on the dangers of teenage pregnancy. The government should invest in initiatives to support strong family relationships and provide young people access to health care, mental health services, and career advice. Additionally, the government should address the root causes of poverty, such as a lack of access to education and employment opportunities.

RELATIONSHIP BETWEEN THE ATTENTION SPAN AND THE SOCIAL MEDIA ENGAGEMENT OF THE STUDENTS OF CALASIAO COMPREHENSIVE NATIONAL HIGH SCHOOL

Gwynette Marie M. Pascual, Justin Mark G. Borja, Dareen James L. Labfey, Princess Judea I. Fernandez, and Libby R. Barberan

*Genesis S. Parel, MAEd
Research Adviser*

Abstract - This study aims to determine the advantages and disadvantages of using social media and how it affects students' attention spans today. The researchers used questionnaires to collect data from 362 respondents in grades 7 through 12 on the campus of Calasiao Comprehensive National High School. The results demonstrate that students have a moderately high attention span, engage in social media use above average, and a weakly positive correlation exists between attention span and social media engagement. Furthermore, social media engagement increases with attention span. The use of social media has an impact on Calasiao Comprehensive National High School students, shortening their attention span. Additionally, students must learn time management skills to use social media effectively and concentrate on their academic performance simultaneously. Based on this, future researchers may carry out additional surveys and community observations in relation to how using social media could seriously affect one's attention span.

Keywords: social media, attention span, engagement

INTRODUCTION

Social media has affected attention span in many ways, by quick and instant pleasure; social media has taken over our attention spans, impacting our brains' ability to focus on anything less intriguing. In addition, social media platforms are designed with users' regular online behavior in mind to capture and hold their interest. As a result, social media may affect people's attention spans by making it difficult to concentrate and finish their work. Studying the

relationship between attention span and social media engagement can help us better understand how users engage with these platforms, what keeps them interested, how to manage distractions, increase attention span and productivity, and identify potential areas for intervention and support. This study aims to determine the attention span, social media engagement, and the relationship between the attention span and social media engagement of the students of Calasiao Comprehensive National High School. This

research will provide new perspectives on improving the attention span of Calasiao Comprehensive National High School students.

METHODS

The researchers used a descriptive correlational research design to determine the relationship between attention span and social media engagement. The data was gathered utilizing a survey questionnaire. The three hundred sixty-two (362) respondents to the study are the 7th to 12th-grade students of Calasiao Comprehensive National High School. The researchers used a survey questionnaire for the instrument, divided into attention span and social media engagement. Regarding attention span, the questions reflect their feelings about working and concentrating. We use the Attention Control Scale (ATTC) by Derryberry, D., and Reed, M. (2002), a four-point scale that is assessed on a Likert scale from 1 (never) to 4 (always). In addition, as for social media engagement, they will reflect on how many times they used social media. We used an eight-point Likert scale by Przybylski, Murayama, DeHaan, & Gladwell (2013), which was assessed on a Likert scale from 0 (not one day) to 7 (every day). Lastly, the data were analyzed using frequency and percentages, a weighted mean, and a Pearson correlation.

RESULTS AND DISCUSSION

The researcher used the Pearson correlation to determine the relationship between attention span and social media engagement.

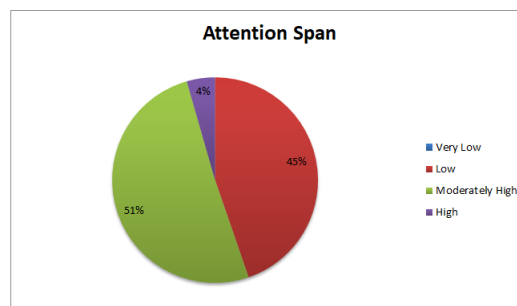

Figure 1. Attention Span

The findings show that the students' attention span at Calasiao Comprehensive National High School is mostly moderately high. Therefore, their feelings about working and concentrating are difficult. Furthermore, in connection with Vidyarthi (2011), the desire for more disturbance or stimulus can make concentration difficult. In addition, according to Heffernan (2010), a person's attention span varies depending on the situation and the type of task. To add, it is being said that people can concentrate longer on certain types of tasks, such as games or conversations because it is an activity that they find enjoyable and stimulating. On the other hand, tasks that are boring, repetitive, and uninteresting to an individual may lead to decreased concentration.

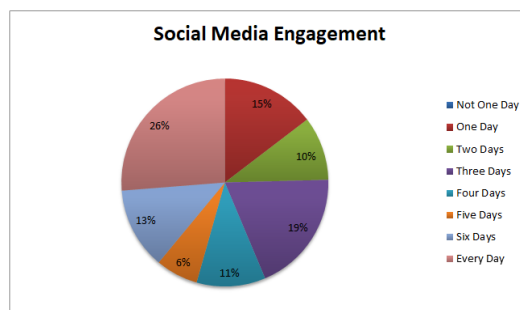

Figure 2. Social Media Engagement

The findings suggest that students at Calasiao Comprehensive National High School have an everyday level of social media engagement, which is the majority. This indicates that they are actively engaging

Calasiao Comprehensive National High School – Senior High School
Humanities and Social Sciences
Calasiao, Pangasinan

on social media, as they use it every day. These results align with Murray's (2022) research, which found that social media use has become widespread in today's society. Like Lampropoulos et al. (2022) noted, social media are used in many different settings and have become an integral part of daily life. As a result, we take advantage of the variety of options in this field to keep in touch with loved ones, do business, and learn about current events worldwide.

Table I. Correlation Between Attention Span and Social Media Engagement

r	critical value	p-value	Strength	Significance
0.19	0.10	<0.01	Weak	Highly Significant

The findings indicate a weak positive correlation between the attention span and social media engagement of the students at Calasiao Comprehensive National High School. According to Cherry (2022), both variables tend to increase in reaction to one another, but the strength of the association is low, as indicated by a weak positive correlation. Individuals with longer attention spans tend to engage more with social media platforms. As a result, people with longer attention spans are more likely to explore and consume a wider range of content on social media platforms. They can dedicate more time and focus to browsing different posts, articles, videos, and discussions. Furthermore, we, the researcher, interpret social media as a certain type of setting that stimulates the attention span of individuals, which is why they engage actively.

CONCLUSION & RECOMMENDATION

The researchers concluded that the attention span of the students of Calasiao Comprehensive National High School is gravely affected by engaging in social media. Based on the Results section, the researchers recommended that the students balance their

priorities and usage of social media, for it affects not only their time management but also their academic performances.

USE OF DIGITAL TECHNOLOGY IN EDUCATION AND ITS IMPACT ON GRADE 12 SENIOR HIGH SCHOOL STUDENTS' ACADEMIC PERFORMANCE

Jessica C. Marty, An An M. Perez, Jasmine C. Visperas, Psalm B. Mancilla, Joseph C. Garcia, and Nina Ricci D. Lopez

Genesis S. Parel, MAEd
Research Adviser

Abstract - This study aimed to identify the use of digital technology in education and how it affects the academic performance of Grade 12 Senior High School Students. The researchers collected data using the Structured Questionnaire Checklist, and the respondents were from a population of Grade 12 Senior High School students of Calasiao Comprehensive National High School. The researchers used Frequency and Percentage distribution and weighted mean as the treatment tools. According to the findings, most students have a high-level mastery of using Digital Technology. Therefore, the researchers conclude that Digital Technology significantly impacts the academic performance of Grade 12 Senior High School students, allowing them to adjust to their own pace of learning and access information, but this can still lead to improvement. Hence, the researchers recommend improving; students should be aware of the potential drawbacks and focus on continual learning to stay abreast of trends.

Keywords: Digital Technology, Academic Performance, Grade 12 learners, Skills, Impact

INTRODUCTION

People currently live in a modern society where digital technology is essential. New platforms and media are expanding in both size and usage every day. Digital technologies can improve the quality of education by making it easier for students to access educational resources and materials. According to a CompTIA study, nine out of 10 students indicated that using technology in the classroom would help prepare them for the digital future. Students have easy access to information, accelerated learning, and enjoyable opportunities to practice their learning (Thakur, 2022).

On the contrary, according to Lynch (2018), students are easily distracted when using technology for academic purposes, making it difficult to multitask. There are disadvantages to using digital technology in education. Digital technologies can be expensive to purchase and maintain, making

them inaccessible to some schools with limited budgets. Digital technologies can also distract students, potentially decreasing focus on learning.

This study was primarily focused on the mastery and impact of using digital technology in education. For the School Year 2022-2023, this study will be conducted at Calasiao Comprehensive National High School. According to the researchers' observations, most Grade 12 Senior High School Students use digital technology. Thus, the researchers focused on the Grade 12 Senior High School Students. The learner must have practical knowledge of using technology by the time they graduate. Moreover, a student who wants to enroll in college should be able to create all types of digital texts, feel at ease using pertinent technology, and use new forms of communication to interact with local and international groups. Additionally, Media

Calasiao Comprehensive National High School – Senior High School

Humanities and Social Sciences

Calasiao, Pangasinan

and Information Literacy, a subject that deals with technology, was provided to Grade 12 students. Only questionnaire forms can be used to collect data.

METHODS

This descriptive, cross-sectional study collected data by survey. The researchers used Stratified Random Sampling to ensure that any particular group did not influence the result of the study. The respondents came from the population of Grade 12 Senior High School students of Calasiao Comprehensive National High School, which is located at Malong Street Poblacion West, Calasiao, Pangasinan. Out of 886 Grade 12 students, 286 were selected as respondents. The demographic profile was described by the researchers using a frequency percentage distribution. In determining the level of mastery in the use of digital technology in education, the researchers interpreted the scores of the responses of respondents using frequency and weighted mean. Meanwhile, in determining how digital technology impacts Grade 12 education, the researchers also interpreted the responses by calculating the frequency and mean.

RESULTS AND DISCUSSION

The researchers surveyed with Calasiao Comprehensive National High School students in Grade 12 to measure their level of mastery in the Use of Digital Technology and their impact on their Academic Performance.

Table 1. Demographic Profile of the Respondents

As seen in Table 1, on age, out of 268 respondents, most of the respondents (172 or 64.18%) are between the ages of 18 and 19, followed by 86 respondents (32.09%) who are between the ages of 16 and 17, 10 respondents (3.73%) who are between the ages of 20 and above, and 0 respondents

(0%), who are between the ages of 15 below. On sex, out of 268 respondents, the majority

Profile	Category	Frequency	Percentage
Age	15 below	0	0%
	16-17	86	32.09%
	18-19	172	64.18%
	20 above	10	3.73%
Sex	Female	150	55.97%
	Male	118	44.02%
Strand	HUMSS	79	29.48%
	ABM	44	16.42%
	STEM	70	26.12%
	TVL HE	38	14.18%
	TVL ICT	37	13.81%

of the respondents are Female 150 (55.97%), and the remaining 118 (44.02%) are Male. On the strand, out of 268 respondents, 79 (29.48%) came from the HUMSS strand.

Table 2. The Respondent's Level of Skills in Using Digital Technology in Their Education

Indicators	Frequency				Mean	Interpretation
	SD	SA	D	A		
1. I can set up projector and use it for my presentation.	17	65	134	52	2.82	A
2. I know how to use a variety of electronic formats (i.e., web publishing, oral presentations, journals, and multimedia presentations) to summarize and communicate results.	9	76	117	66	2.90	A
3. I know how to use search engines like google and chrome.	8	19	85	156	3.45	SA
4. I know how to analyze information and check the sources if it's reliable.	6	27	124	111	3.27	SA
5. I know how to be safe online and know how to have responsible online behavior (i.e., avoid sharing personal information through online).	11	18	101	138	3.37	SA
6. I know how to use Computer Fundamentals (i.e., Input, processing, output, and storage).	6	54	131	77	3.04	A
7. I know how to use Microsoft Excel or similar spreadsheet's software.	10	64	119	75	2.97	A
8. I know how to set Network Security Control (i.e., anti-virus software and passwords).	9	73	99	87	2.99	A
9. I know how to identify file whether it is malicious or not.	7	70	117	74	2.96	A
10. I have the capacity to communicate socially and professionally using email, messaging, and social media.	4	27	100	137	3.38	SA
Weighted Mean					3.11	A

Note: 1.00 – 1.75 = SD, "Strongly Disagree", 1.76 – 2.5 = D, "Disagree", 2.6 – 3.25 = A, "Agree", 3.26 – 4.00 = SA, "Strongly Agree."

According to the findings, most respondents have mastered using digital technology in education, with an average of 3.11.

Meanwhile, the majority of

Calasiao Comprehensive National High School – Senior High School

Humanities and Social Sciences

Calasiao, Pangasinan

respondents, regardless of age, sex, and strand, are depicted in the figure below as being skilled in using digital technology.

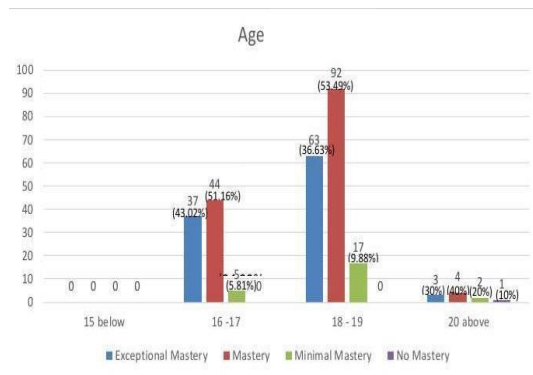

Figure 1. Age Distribution in terms of Skills in Using Digital Technology

Figure 1 demonstrates that 53.49% of the respondents have a mastery of employing digital technology in education are most often between the ages of 18-19.

Figure 2. Sex Distribution in terms of Skills in Using Digital Technology

Figure 2 shows that with a percentage of 53.33%, women are more likely than men to be respondents who are proficient in using digital technology.

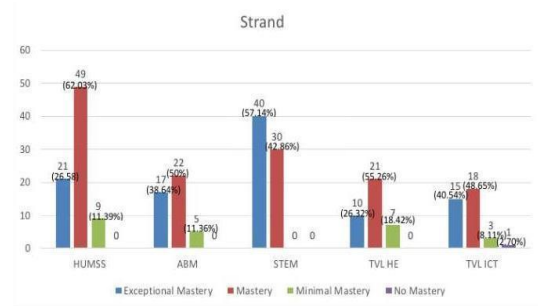

Figure 3. Strand Distribution of Skills in Using Digital Technology

As indicated in Figure 3, with a percentage of 62.03%, the HUMSS strand has the highest proportion of proficient responders in using digital technology in education. However, some students lack the skills they need when it comes to projector setup when using a variety of electronic formats, using computer fundamentals, etc. The likelihood of a student succeeding in school can be significantly increased if they can use digital tools like computers, the internet, and other types of technology. These findings are in accordance with research from Reinhold et al. (2020), which shows that the proper use of information technology promotes and develops a variety of skills in students, such as mathematical skills, communication skills, critical thinking skills, problem-solving skills, teamwork skills, and research skills.

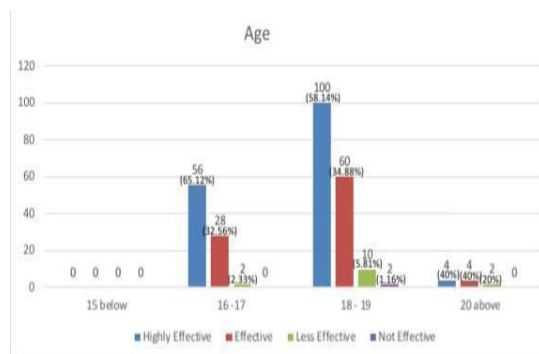

Table 3. The Respondent's Level of Impact on Using Digital Technology in Their

Education

Meanwhile, the majority of respondents, regardless of age, sex, and strand, are depicted in the figure below who found digital technology in education as highly effective.

Figure 4. Age Distribution in Terms of Impact on Using Digital Technology

With a percentage of 58.14%, the majority of respondents who are between the ages of 18 and 19 believe that digital technology is highly effective.

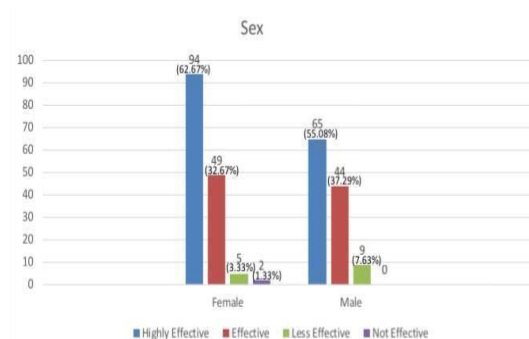

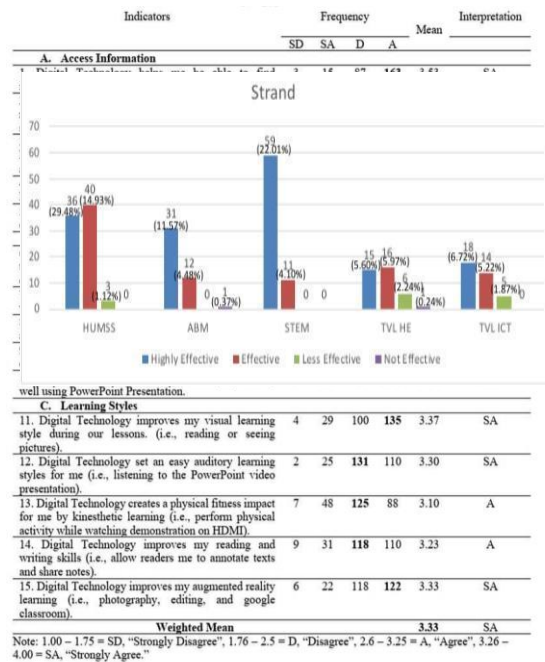

Figure 5. Sex Distribution in Terms of Impact on Using Digital Technology

Majority of respondents are female and that 62.67% of them chose the strongly agree response, demonstrating the high effectiveness of using digital technology in

education.

Figure 6. Strand Distribution in Terms of

Impact on Using Digital Technology

With a percentage of 84.29%, STEM students have the highest probability of believing that digital technology is highly effective. These results are consistent with other studies, such as Ignacio et al. (2015), which found that using digital technology helps students focus and concentrate on their academic work.

CONCLUSION & RECOMMENDATION

The study shows that senior high school students are skilled in general computer usage and technology but have room for improvement in more advanced digital skill sets. The study's findings have revealed that digital technology greatly impacts the academic performance of Grade 12 senior high school students, with an average of 3.33 in access to information, interactivity, and learning styles, which is highly effective. The results have also shown that while students have a high mastery of

digital technologies, they can still improve when setting up projectors and using a variety of electronic formats, as evidenced by the average of 2.82, interpreted as mastery. The academic performance of Grade 12 Senior High School students is significantly impacted by digital technology, but there are also potential negative effects like addiction, mental health issues, and interpersonal conflicts. The researchers recommend that learners who want to improve their digital skills should be conscious of the potential negative effects and concentrate on lifelong learning to stay current with trends. The teacher should also facilitate group projects and collaboration and have students collaborate to create digital products or solve digital problems. Also, teachers should provide hands-on activities with feedback. Promote the students to be healthy digital citizens. Incorporating the negative effects, particularly the potential harm to mental health, is crucial when instructing kids on utilizing digital technology acceptably. Future researchers should focus on continual learning in using digital technologies.

FACTORS INFLUENCING THE PREVALENCE OF SELF-DIAGNOSIS OF DEPRESSION AMONG STUDENTS AT CALASIAO COMPREHENSIVE NATIONAL HIGH SCHOOL

Ace Christian M. Pobre, Mikylla Jean B. Carcha, Jennylyn F. Doria, Jonalyn May P. Nigos, Florence Joyce M. Flores, Jeffrich M. Parizal,

Genesis S. Parel, MAEd
Research Adviser

Abstract - Self-diagnosing depression can negatively affect individuals and the population. Hence, the researchers explored the factors that may cause its prevalence in this descriptive-correlational study by surveying the students of Calasiao Comprehensive National High School. With the majority having high social media engagement, the population had a high prevalence of self-diagnosis of depression and a lower prevalence of clinical diagnosis, which hints at a lack of access to or stigma towards seeking professional help. While individuals with high self-esteem will most likely be undiagnosed with depression, those with average self-esteem are most likely to self-diagnose, which hallmarks malingering and fake depression trends in the population. Such an indication could lead to further stigma surrounding the said mental illness, which could hinder those who truly suffer from it from seeking professional help.

Keywords: *students, self-diagnosis, depression, factors, relationship, prevalence*

INTRODUCTION

Depression is a common but significant mood disease characterized by severe symptoms that interfere with everyday activities. Teenagers and young adults are increasingly self-diagnosing their mental problems online, which, according to Caron (2022), can result in inaccurate labeling, avoiding a professional assessment, and embracing inefficient or incorrect treatments. Researchers wanted to explore the factors that may initially influence a student's self-diagnosis of depression.

Based on the report of the World Health Organization from 2023, depression affects 3.8% of the population globally, including 5.0% of adults and 5.7% of adults over the age of 60. Self-diagnosis is looking up a symptom or medical sign online to determine whether a person has a condition.

However, people are prone to making errors in their self-diagnoses, so Thatcher (2021) discouraged individuals from trying to self-diagnose their conditions. In the Philippines, a recent poll found that Filipinos would rather look up medical information on Google and treat themselves at home than go to the doctor. The practice of self-diagnosis has grown in popularity because of search engines and social media, which allow individuals to obtain medical information and self-diagnosis without consulting a medical expert. However, because of the potential hazards, this movement has prompted worries. This study aims to determine the factors that may influence youth to self-diagnose depression and to promote awareness of the dangers of self-diagnosis. It will be a guiding principle for students, demonstrating that their mental health

situation is valuable enough to warrant more than just a Google search.

This study seeks to know the demographic profile of the respondents in terms of their sex, age, identification, and diagnosis of depression, social media engagement, and level of self-esteem. It also aims to determine if there is a significant relationship between the demographic profile of the respondents and the prevalence of self-diagnosis of depression.

METHODS

The researchers employed a Descriptive-Correlational Research Design to describe the population and the relationship between identified factors that may influence the prevalence of self-diagnosis among the respondents.

The researchers used a structured survey questionnaire to collect data from Calasiao Comprehensive National High School students' demographic profiles, such as sex, age, identification and diagnosis of depression, social media engagement, and level of self-esteem. They have adopted two research questionnaires: the Social Media Engagement Questionnaire (SMEQ) by Przybylski et al. (2013) and the Rosenberg Self-Esteem Scale (RSE) by Rosenberg (1965). The SMEQ helps to gather the duration of social media engagement on a weekly basis, while the RSE is a ten-item self-reported self-esteem measure comprising ten items relating to overall feelings of self-worth or acceptability.

Given the high school's huge population, 362 were chosen as respondents from the 6351-student population, calculated using the Cochran Formula under a 5% margin of error. Furthermore, because the respondents will be separated into smaller subgroups, the researchers utilized stratified random sampling to select the respondents of the study. Respondents from grades 7 and 11 selected 54 respondents, while 36 were selected from Grades 8 and grade 12, and 91

respondents were from Grades 9 and Grade 10. To analyze the data from the respondents, the researchers used the following statistical tools for data analysis: Frequency and Percentage, Distribution and Weighted Mean to describe the demographic profile of the respondents, and Chi-square test to identify the relationships between the variables of interest.

RESULTS AND DISCUSSION

Data was studied and questionnaires were examined to answer questions related to sex, age, identification and diagnosis of depression, social media engagement, and level of self-esteem.

Table 1. Demographic Profile of the Respondents

Profile	Category	<i>f</i>	%
Sex	Male	123	33.98%
	Female	239	66.02%
Age	15 Below	202	55.80%
	16-18	155	42.82%
	19-20	5	1.38%
Identification and Diagnosis of Depression	Undiagnosed	185	51.10%
	Clinically Diagnosed	17	4.7%
	Self-Diagnosed	160	44.20%

As seen in Table 1, most respondents were female (66.02%). Meanwhile, regarding the respondents' age, many were 15 years below (55.80%), which could be an unsafe and dangerous age for depression self-diagnosis. Barsch (2022) stated that it is extremely concerning that children can develop false self-diagnosis and treatment plans because of a lack of expert advice. Teenagers could also see misleading information or accounts that serve as triggers for those suffering or promote risky behavior like cutting. Finally, regarding the respondents' demographic profile in terms of identification and diagnosis of depression, out of 362 respondents, 51.10% were undiagnosed. Plumptre (2023) writes in a similar idea that being free of mental health issues such as depression is beneficial to

one's health because they are undiagnosed with depression, they have excellent mental health, which allows them to be stronger when dealing with life's stresses, have a positive self-image, have healthier relationships, have greater productivity, and job efficiency, and have a higher quality of life. While the results may indicate a positive mental state in the population, this may also imply that most do not have access to seeking professional help or do not result in self-diagnoses. Furthermore, 4.70% of the respondents were clinically depressed. This implies that there are still students diagnosed as depressed by medical professionals. Although most respondents were undiagnosed, it also shows that many self-diagnose (44.20%), which may lead to negative consequences. The prevalence of self-diagnosis further implies a lack of access to professional help in the locale.

Meanwhile, as one of the study's variables, the researchers also surveyed and gathered data from the respondents regarding their Social Media Engagement. Table 2 summarizes the results:

Table 2. Social Media Engagement of the Respondents

Indicator	Social Media Engagement									
	NE	VSE	SE	LE	ME	E	HE	VHE	M	DE
1. How often do you use social media in the 15 minutes before you go to sleep?	17	24	19	19	14	11	5	253	5.61	DE
2. How often do you use social media 15 minutes after you wake up?	29	30	39	33	18	23	11	179	4.73	E
3. How often do you use social media when eating breakfast?	106	42	32	39	16	14	5	108	3.16	LE
4. How often do you use social media when eating lunch?	83	45	33	26	19	27	11	118	3.57	ME
5. How often do you use social media when eating dinner?	103	26	22	36	16	26	10	123	3.57	ME
Total weighted mean									4.13	ME

Note: Highest frequencies are in boldface; DE=Descriptive Equivalent; WM=Weighted Mean
 Legend: 0 (NE-Not Engaged at All); 1.00-1.85 (VSE-Very Slightly Engaged); 1.86-2.70 (Slightly Engaged); 2.71-3.55 (LE-Least Engaged); 3.56-4.40 (ME-Moderately Engaged); 4.41-5.25 (E-Engaged); 5.26-6.10 (HE-Highly Engaged); 6.11-7.00 (VHE-Very Highly Engaged)

All the indicators answered by the respondents imply that most of the respondents are Very Highly Engaged in using social media. This means social media

has revolutionized how people interact with others, offering unparalleled connectivity and information sharing (Beth, 2022). However, multiple studies published by Kumar et al. (2023) show that being Very Highly Engaged in using social media or extensive social media usage has shown a substantial link between the increased risk of depression, self-harming, anxiety, and loneliness.

Using the Rosenberg Self-esteem Scale, the researchers identified the respondents with low self-esteem and those with a normal and high self-esteem range. The table below summarizes the results:

Table 3. Level of Self-Esteem of the Respondents

Level of Self-Esteem	f	%
Low Self-Esteem	6	1.66%
Normal Self-Esteem	187	51.66%
High Self-Esteem	169	46.69%

Table 3 revealed that out of the 362 respondents, only 6 (1.66%) have low self-esteem. Low self-esteem is generally considered a negative trait, as it is associated with a range of adverse outcomes, including depression, anxiety, and poor physical health (Orth et al., 2008). Having a group or population with low self-esteem is not good because it can contribute to various social problems, such as bullying, social withdrawal, and low academic achievement (Baumeister et al., 1996). While the majority of the respondents having normal self-esteem is a relatively good indication, there is still room for improvement and development in an individual's self-esteem. Nevertheless, many students also have high self-esteem, a positive attribute of the population. A study conducted by Orth & Robins (2022) discovered that those with high self-esteem have higher academic and occupational achievement, better social relationships, better mental and physical health, and less antisocial behavior. These advantages last from youth to adulthood and beyond.

Using the data gathered from the demographic profiles of the respondents, the

researchers tested the relationship between the variables using the chi-square test:

Table 4. Chi-Square Test Results

Factors	X ²	Alpha	df	P-value	Decision
Sex	5.48	0.05	2	0.064	Not Rejected
Age	3.71	0.05	4	0.447	Not Rejected
Social Media Engagement	19.1	0.05	24	0.748	Not Rejected
Level of Self-Esteem	19.2	0.05	4	<0.01	Rejected

The results above reveal that sex, age, and social media engagement do not have a significant relationship with the prevalence of self-diagnosis of depression. Regardless of the respondent's sex, there is a tendency in the population to self-diagnose. While this contradicts the current literature on the relationship of sex towards depression self-diagnosis, other factors may have indirectly influenced the two, given its p-Value. Furthermore, regardless of age, respondents tend to self-diagnose, which could be because they are all in the adolescent stage. According to Quraishi et al. (2023), teens increasingly seek alternative support and education and use social media sites like TikTok to self-diagnose mental health disorders. Such findings are also applicable since the majority have high social media engagement.

Meanwhile, the Level of Self-Esteem has a significant relationship to the prevalence of self-diagnosis of depression.

Table 5. Contingency Table of Identification and Depression Diagnosis and Level of Self-Esteem

Identification and Depression Diagnosis	Level of Self-Esteem			Total
	Normal	Very High	Low	
Clinically Diagnosed	9	7	1	17
Self-Diagnosed	101	56	3	160
Undiagnosed	77	106	2	185
Total	187	169	6	362

Table 5 illustrates that people with the Normal Range of Self-Esteem tend to self-diagnose themselves more, hinting at the promulgation of a fake depression trend in the population, in which an individual may

pretend to be depressed even though they are not. People should not resort to self-diagnosis because it promotes malingering, in which individuals may fake or exaggerate symptoms to get benefits and manipulate or avoid the negative consequences of their actions (Schimelpfening, 2022). According to Johansson (2021), if someone is just "depressed" over particular things but becomes quickly joyful again, it could be a symptom of faking depression. Malingering in the population may also increase the stigma surrounding depression, which could negatively impact those suffering from it. Furthermore, Table 5 also suggests that people with high self-esteem are more likely to not self-diagnose or tend to be undiagnosed with depression. This reflects the findings of Baumeister et al. (2003) that high self-esteem does correlate with many positive outcomes, such as getting better grades, being less depressed, and feeling less stressed (Jhangiani and Tarry, 2022). Because high self-esteem people are more confident in themselves, they will not have self-doubt whether they have depression when dealing with pressure or bad life situations. The fact that most respondents have high self-esteem suggests that they have not been diagnosed with or without depression.

CONCLUSION & RECOMMENDATION

Self-diagnosis has grown in popularity with search engines and social media, allowing individuals to obtain medical information and self-diagnosis without consulting a medical expert. However, because of the potential hazards, this movement has prompted worries. The researchers investigated potential factors that may influence youth to self-diagnose depression, hoping to promote awareness of the dangers of self-diagnosis and gain insight into self-diagnosis in a Philippine context. The students of Calasiao Comprehensive

Calasiao Comprehensive National High School – Senior High School
Humanities and Social Sciences
Calasiao, Pangasinan

National High School, predominantly female and aged 15 and below, show a high prevalence of self-diagnosis of depression and a lower prevalence of clinical diagnosis, which hints at a lack of access to or stigma towards seeking professional help. The population also consists mostly of individuals with average self-esteem and very high social media engagement. While individuals with high self-esteem will most likely be undiagnosed with depression, those with average self-esteem are most likely to self-diagnose, which hallmarks malingering and fake depression trends in the population. Such an indication could lead to further stigma surrounding the said mental illness, which could hinder those who truly suffer from it from seeking professional help.

Given the preceding conclusion, parents should keep an eye on their children's social media activity and educate them on how to use it responsibly. Psychiatrists can provide health education focusing on the real meaning of depression; the Supreme Student Government should offer psychological support and programs promoting mental health awareness; and students of Humanities and Social Sciences with the collaboration of the UNESCO club, Culminating Activity, and Community Engagement, can carry out a project that promotes self-esteem awareness. Further research into the relationship between sex, age, social media engagement, and the prevalence of self-diagnosis of depression may be done to raise awareness and provide new information.

INTEGRATION OF THE SAMR MODEL AMONG SENIOR HIGH SCHOOL TEACHERS AT CALASIAO COMPREHENSIVE NATIONAL HIGH SCHOOL

Geraldine A. Feria, Rhena Mae I. Molina, John Kepner B. Mangaliag, Harwen Loyd B. Papio, and Reyzel G. Barongan

Genesis S. Parel, MAEd
Research Adviser

Abstract - *The SAMR approach, created by Puentedura, divides technology use in teaching and learning activities into four categories: substitution, augmentation, modification, and redefinition. This study examines how well the SAMR model, a framework that shows how technology may increase efficiency in teaching and learning, is integrated. A survey questionnaire was used to gather information from 50 respondents among Senior High School teachers at Calasiao Comprehensive National High School. A correlational research design was used to analyze the collected data. The investigation found that ICTs were heavily integrated into preparing lecture notes, assignments, and exams, and search engines were used to find research materials among the teachers in the school. The SAMR model was moderately integrated into the lessons of a Senior High School teacher at Calasiao Comprehensive National High School. Teachers can still improve in integrating SAMR Model in their lessons, regardless of their background.*

Keywords: *Augmentation, Integration, Modification, Redefinition, Substitution*

INTRODUCTION

The 21st century has been described as the century of technological advancement due to the widespread use of social media networks. After the COVID-19 outbreak, our nation has been struggling, and one way to sustain the operation of education is to employ social media through technology. Multiple studies have found that using technology in the classroom can increase students' proficiency in various subject areas. Puendetura developed the SAMR (Substitution, Augmentation, Modification, and Redefinition) approach, categorizing technology use in teaching and learning activities into four categories: substitution, augmentation, modification, and redefinition. Franco (2019) stated that incorporating technology into the curriculum

can improve learning, but selecting the best technology can be difficult. To advance teaching and learning, instructors are encouraged to reflect on their technology use and change how they incorporate it into their practices using the SAMR paradigm. This model encompasses all aspects of technological integration, and even the most accomplished people can be challenged to redefine learning. According to (Oxnevad, 2013), today's teachers are expected to use technology in their teaching practices. However, Handoko (2020) stated that despite the laws and wide range of learning devices accessible, some teachers might encounter difficulties and opt not to use technology in their classes. Addressing such issues, the SAMR model demonstrates that incorporating technology involves selecting

Calasiao Comprehensive National High School – Senior High School
Humanities and Social Sciences
Calasiao, Pangasinan

appropriate learning tools and figuring out how to use technology to enhance students' learning process (Floris & Renandya, 2017). Hence, connecting the framework with the current state of teaching and learning will be simpler for teachers using the SAMR model. This study aimed to describe the SAMR model's integration into lessons of teachers in the researcher's locale, Calasiao Comprehensive National High School. The researchers believed that by describing the characteristics of the teacher population of the senior high school program in their school, they would be able to help evaluate and diagnose the needs of these teachers to equip better and prepare them for teaching in the 21st Century.

METHODS

The researchers employed a Correlation Research design. This design was chosen for its suitability for instructional output planning and development. The study's objective is quantitative since it must find several relationships among different variables or give descriptive data. The researchers collected data for this quantitative study with an organized survey questionnaire to indicate an effect. The organized survey questionnaire was used to collect efficient data and determine whether the results matched the study's objectives; therefore, the researchers frequently modified existing questionnaires constructed and used by Jude et al. (2014) to suit the research objectives better.

The researchers adopted, modified, and validated a questionnaire as data collection instrument from 50 respondents among Senior High School teachers at CCNHS. By calculating the Fleiss - Kappa, the rater agreement between the validators was also examined to ensure reliability. The result interpretation of validators yielded a 1.00, which indicates Perfect Agreement. The results indicate that the data-gathering instrument has acceptable validity and

reliability. They used descriptive statistics to analyze the data quantitatively and calculated the relationship of the variables using Chi-Square test.

RESULTS AND DISCUSSION

The tables below show the results, the data analysis, and the interpretation of data gathered based on the survey questionnaires distributed to the Senior High School teachers at Calasiao Comprehensive National High School.

Table 1. Demographic Profile of the Respondents

Profile	Category	Frequency	Percentage
Sex	Male	21	42%
	Female	29	58%
Age	Under 25		
	25-29 Years Old	0	0%
	30-39 Years Old	14	28%
	40-49 Years Old	18	36%
	50-59 Years Old	12	24%
	60-65 Years Old	6	12%
	66-70 Years Old	0	0%
	Bachelor's Degree		
	Highest Educational Attainment	13	26%
	Master's Degree	31	62%
Years of Teaching Experience	Doctorate Degree	6	12%
	1-2 Years	3	6%
	3-5 Years	9	18%
	6-10 Years	23	46%
	11-15 Years	2	4%
	16-20 Years	8	16%
Teaching Positions	Above 20	5	10%
	Teacher I		
	Teacher II	2	4%
	Teacher III	32	64%
	Master	7	14%
	Teacher I	2	4%
	Master	7	14%
Specialization	Teacher II		
	Science		
	English	9	18%
	Filipino	9	18%
	Mathematics	2	4%
	Social Studies	5	10%
	Others	2	4%
		23	46%

As seen in Table 1, out of 50 respondents, those between the ages of 30 and 39 had the most significant percentage of respondents (18 or 36%), while those between the ages of 50 and 59 had the lowest population (6 or 12%).

With 58% of respondents, female

Calasiao Comprehensive National High School – Senior High School
Humanities and Social Sciences
Calasiao, Pangasinan

instructors had a higher value percentage than male teachers, who had 42% of the population. Additionally, Regalado (2017) stated that census data shows that women predominate in the teaching profession in the Philippines. Both in public elementary and high schools, there are more female instructors than male teachers. However, Ding (2021) found that male and female teachers' workloads in terms of teaching are similar. However, there is a considerable difference in their workloads regarding research, with male instructors having a significantly higher burden.

Six to ten years (6 to 10 years) of teaching experience have received the highest percentage in terms of length of service, with 23 respondents, or 46% of the population, whereas 1-2 years of teaching experience received the lowest percentage, with only 6%, or three respondents out of the 50 total population. In connection to that, Ünal & Ünal (2012), experienced instructors are likelier than starting teachers to like to be in charge in their classrooms while dealing with students and making choices. However, the claim that novice instructors are less qualified than seasoned educators is unsupported by any evidence. On the other hand, experienced teachers are believed to have combined years of service and a repertoire of classroom skills and strategies.

Out of 50 population respondents, 62% had a master's degree as their highest level of education, while a doctorate has the lowest percentage, with six respondents or 12% of the total population. Moreover, according to Dixon & Ward (2015), teachers' motivations for pursuing academic study were closely related to their views on what it means to be a teacher and how professional practice might be improved. Enrolling in and finishing a master's degree program, teachers were considered to have the opportunity to learn new information, abilities, and understanding through analyzing,

dismantling, and rebuilding their professional activity.

Most (64%) of all teaching positions, or 32 out of 50 respondents, were in Teacher II. However, Teacher I and Master Teacher II had 4%, or two replies, respectively. The responsibilities of one teaching post and those of other teaching roles are identical. Everyone is involved in classroom instruction. Hence, instead of the roles' dominant functions and responsibilities and qualification criteria, teaching positions are classified primarily based on the personal qualification of the occupants. Moreover, some instructors adopted the technique without significantly changing their teaching philosophies since it was congruent with their established identities. They discussed how the model aided them as the instructors they had always envisioned themselves as (Keller, 2018).

With 23 respondents, 46% of the population, instructors with other specializations had the highest value percentage. A distal indicator of teacher quality is teacher specialization. However, student impressions of instructional quality are a proximal metric becoming more frequently employed to assess teacher effectiveness.

Calasiao Comprehensive National High School – Senior High School **Humanities and Social Sciences** **Calasiao, Pangasinan**

Table 2. Level of Integration of SAMR Model (Substitution)

The table shows that the highest weighted mean is 4.76 with a descriptive rating of "Very Highly Integrated," which is in the indicator, "I use ICTs to prepare my lecture, assignments, and examinations." On the other hand, the table also shows the indicator, "I record my lectures on CDs or other media and give them to my students." the lowest weighted mean of 2.32 with a descriptive rating of "Least Integrated." However, the overall average mean below the level for substitution is 3.41, which is categorized as highly integrated.

In addition to that, Moore (2017) stated that the substitution level is a potent instrument in education since it is the simplest to install and use and has the following advantages: it lowers the carbon footprint, makes content available worldwide, and saves time and resources for both students and instructors. It gives the

INDICATORS	VHI	HI	MI	LI	NI	MEAN	DESCRIPTIVE RATING
1. I assign students topics to research about from internet.	13	20	14	0	3	3.80	Highly Integrated
2. I use open education resource.	13	19	12	1	5	3.68	Highly Integrated
3. I use group discussion facility.	10	19	15	2	4	3.58	Highly Integrated
4. I teach modules in course using e-learning platforms.	9	13	19	4	5	3.34	Moderately Integrated
5. I use my cellphone to teach academic support.	10	15	14	6	5	3.38	Moderately Integrated
6. I use internet to cellphone messaging.	25	14	7	1	3	4.14	Highly Integrated
7. I use content authoring software.	9	9	16	9	7	3.08	Moderately Integrated
8. I use facebook with my students.	19	12	7	5	7	3.62	Highly Integrated
9. I use online assessment tool.	14	15	12	3	6	3.56	Highly Integrated
10. I use video conferencing.	9	10	15	8	8	3.56	Highly Integrated
Total Weighted Mean						3.57	HI

Note: 1.00-1.80, "NI" (Not Integrated); 1.81-2.60 "LI" (Least Integrated); 2.61-3.40 "MI" (Moderately Integrated); 3.41-4.20, "HI" (Highly Integrated); 4.21-5.00, "VI" (Very Highly Integrated).

educational process a solid foundation. Thus, it is simple to understand how a teacher may convert a classroom activity to a substitute (Place, 2022).

Table 3. Level of Integration of SAMR Model (Augmentation)

The indicator "I use search engines (e.g., Google) to look for vital research content in my discipline" has the highest weighted mean of 4.08 with a descriptive

rating of "Highly Integrated." On the other hand, the table also shows that the indicator "I provide feedback to students reports, papers, and assignments through their e-mails" has the least weighted mean of 3.08 and is categorized as "Moderately Integrated." It also indicates the total average mean, which is 3.53, which only means the augmentation of the SAMR model is highly integrated into the lessons of CCNHS Senior High School teachers. Moreover, Best (2020) stated that At the augmentation level, beyond just being convenient, technology may enhance learning by giving students a greater understanding of complicated subjects and making them more interesting. Additionally, it enables more independent and student-centered learning, enabling learners to begin actively learning without constantly needing instructor-driven teaching.

INDICATORS	5	4	3	2	1	MEAN	DESCRIPTIVE RATING
1. I use ICT's to prepare my lecture notes, assignments and examination.	39	10	1	0	0	4.76	Very Highly Integrated
2. I use Power Point presentation method to deliver my lectures.	39	10	0	1	0	4.74	Very Highly Integrated
3. I upload my teaching and learning materials on different e-learning platforms (example: google meet, zoom, canvas, youtube, facebook etc.) for students to access.	16	13	16	3	2	3.76	Highly Integrated
4. I refer my students to electronic databases for reference materials instead of hard copy textbook.	10	20	16	2	2	3.68	Highly Integrated
5. When supporting my students, I communicate to them using my cell phone.	2	6	12	6	2	2.70	Moderately Integrated
6. During my lectures, I use the smart boards-interactive boards installed in the lecture rooms for writing instead of the chalkboard.	16	6	12	9	7	2.70	Moderately Integrated
7. I prepare the students to submit their course work assignment through email.	6	8	20	11	5	2.98	Moderately Integrated
8. When supporting my students, I communicate to them through social media such as facebook, twitter, chat rooms, discussion boards, etc.	16	17	10	5	2	3.80	Highly Integrated
9. I take video/audio recordings of myself while lecturing and use them in subsequent years to teach the same course to another cohort of students.	6	7	11	17	9	2.68	Moderately Integrated
10. I record my lectures on CD's/other media and give them to my students.	5	5	5	15	17	2.32	Least Integrated
Total Weighted Mean						3.41	HI

Note: 1.00-1.80, "NI" (Not Integrated); 1.81-2.60 "LI" (Least Integrated); 2.61-3.40 "MI" (Moderately Integrated); 3.41-4.20, "HI" (Highly Integrated); 4.21-5.00, "VI" (Very Highly Integrated).

Calasiao Comprehensive National High School – Senior High School

Humanities and Social Sciences

Calasiao, Pangasinan

Table 4. Level of Integration of SAMR (Modification)

The "I use the internet to cellphone messaging" indicator has the highest weighted mean of 4.14 with a descriptive rating of "Highly Integrated." On the other hand, the table also shows that the indicator "I use content authoring software" has the least weighted mean of 3.08 and is categorized as "Moderately Integrated." It also indicates the total average mean, which is 3.57, which only means the modification of the SAMR model is highly integrated into the lessons of CCNHS Senior High School teachers. Additionally, Fastiggi (2015) stated that technology at the modification level improves learning activities and significantly modifies them. One illustration would be students publishing their work on blogs that are accessible to readers all around the world. Due to the increased accountability the blog brings, students will often spend more time editing their written work. Both student learning and literacy advance in this way.

Table 5. Level of Integration of SAMR Model (Redefinition)

The table shows that the highest weighted mean is 3.38, with a descriptive rating of "Moderately Integrated," which indicates, "I use open education resources as my study materials." While the lowest weighted mean is 2.98, with a descriptive rating of "Moderately Integrated," which is the indicator, "I use electronic games/simulation/second life." Moreover, the table also shows a total average of 3.09, which

means that the redefinition level of the SAMR model is moderately integrated. Thus, Best (2020) stated that redefining learning entails leveraging technology to develop new learning possibilities, link classroom instruction to the outside world, and generate genuine results. Additionally, it helps students develop strong, soft skills in technology, including digital communication, cooperation, technological literacy, and system adaptability.

Table 6. Chi-Square Test Results

INDICATORS	VHI	LI	MI	LI	NI	MEAN	DESCRIP- TIVE RATING
1. I use search engines (e.g. google) to look for vital research content in my discipline.	26	14	3	2	5	4.08	Highly Integrated
2. I use the editorial tools in my word processor to correct grammatical errors in any documents I process.	9	18	8	7	4	3.56	Highly Integrated
3. I use the editorial tools in my word processor to receive alternative words to use in my essays.	9	18	12	4	7	3.36	Moderately Integrated
4. I use online dictionaries like wikipedia to make meaning of the words phrases that I do not understand.	16	15	10	5	4	3.68	Highly Integrated
5. I use digital libraries as a source of useful content for my lectures.	13	23	6	5	3	3.76	Highly Integrated
6. I use track changes in my word processor to review communal documents or student's dissertation.	5	17	19	3	6	3.24	Moderately Integrated
7. I use internet group list to contact my students in matters related to their academic.	17	18	7	3	5	3.78	Highly Integrated
8. I use citation tools like endnote to improve on the citation and referencing quality of scholarly work.	11	16	15	4	4	3.52	Moderately Integrated
9. I encourage my students to use google docs to accomplish group assignment course work.	8	14	17	5	6	3.26	Moderately Integrated
10. I use bulk messaging to contact my students in matters related to their academic.	12	11	16	6	5	3.38	Moderately Integrated
11. I subject my scholarly work to plagiarism test using plagiarism detection software.	9	17	14	7	3	3.44	Highly Integrated
12. I provide feedback to students reports, papers, and assignments through their e-mails.	8	12	15	6	9	3.08	Moderately Integrated
13. I use google docs to share documents with my students.	12	14	14	6	4	3.48	Highly Integrated
14. I use different videos to illustrate different case studies during my lectures.	14	17	15	1	3	3.76	Highly Integrated
Total Weighted Mean						3.53	HI

Note: 1.00-1.80, "NI" (Not Integrated); 1.81-2.60 "LI" (Least Integrated); 2.61-3.40 "MI" (Moderately Integrated); 3.41-4.20, "HI" (Highly Integrated); 4.21-5.00, "VI" (Very Highly Integrated).

As shown in Table 3, age has a significant relationship to the substitution level and augmentation level of the SAMR model, where younger teachers are most likely to have higher level of technology integration. Highest educational attainment also has a significant relationship to the level of substitution and modification of the SAMR model. However, all factors in the demographic profiles have no significant relationship on integration of higher phases of the SAMR model.

The findings suggest that the level of substitution and augmentation of the SAMR model in the teachers' lessons may be

influenced by their demographic profile in terms of age and their level of education in incorporating the SAMR model. However, according to McKnight (2016), whether a digital conversion for schools, districts, and states is successful depends more on how well it supports teaching and learning than on the technology itself. In addition, according to the research of Flores (2022), the age and number of years a teacher had spent in the classroom—notably if they taught science—impacted how they integrated ICT.

CONCLUSION& RECOMMENDATION

Most teachers at Calasiao Comprehensive National High School have master's degrees and six to ten years of experience in the classroom. The majority of the teaching positions, which belonged to Teacher II, were in the social studies field. Search engines like Google were utilized to locate crucial research resources, and ICTs were substantially integrated into creating lecture notes, assignments, and tests. Facebook, text messages, and e-learning platforms were also used to communicate with pupils. Calasiao Comprehensive National High School Senior High School teachers highly integrated the Substitution, Augmentation, and Modification levels of the SAMR model, and only the redefinition level was moderately integrated. While Age and Highest Educational Attainment show to have significant relationship to lower phases of SAMR Model, the teacher' profiles showed no relationship towards higher level of the model's integration, suggesting that improvements on its integration among the lessons of the teachers could still be made among the teachers, regardless of their background.

The technology significantly impacts education, particularly how teaching is given and how students are educated. Teachers should examine their technology use and modify how they incorporate it into their activities using the SAMR paradigm. An

alternative interpretation of the SAMR model is suggested that is more adaptable, non-hierarchical, and based on sociocultural theory. Technology increases engagement and helps students, but technology, pedagogy, and administration challenges may not be worth the learning benefits. Mobile technologies are essential to the design of m-learning activities, but instructional designers should carefully examine how to handle technological, pedagogical, and managerial difficulties.

Future researchers should use this work to improve the integrating of the SAMR model's redefinition level into the educational system. Savignano (2017) proposed three improvements to the SAMR paradigm, including converting the model into a box-shaped diagram, including the SAMR paradigm in instructional design models, and introducing new terminology to the digital citizenship standards.

CORRELATION OF FEMINISM IDEOLOGIES TO THE GENDER ROLE PERCEPTION OF FEMALE TEACHERS OF CALASIO COMPREHENSIVE NATIONAL HIGH SCHOOL

Ashley S. Capua, Karen Angela R. Prejula, Shane A. Orienza, Ces Athea Kristelyn D. Vinuya, and Bimbo S. Estrada

Genesis S. Parel, MAEd
Research Adviser

Abstract – *Feminism Ideologies refers to the diverse beliefs and principles that form the foundation of feminist attitudes and behavior. These ideologies aim to challenge and dismantle gender inequalities, patriarchal power structures, and discrimination based on gender. Meanwhile, Gender role Perception refers to how individuals understand and internalize societal expectations and norms regarding behaviors, attitudes, and characteristics deemed appropriate for individuals based on their gender. This study recommends continuously empowering women to promote gender equality and inclusivity in teaching. The analysis revealed that feminism ideologies and gender role perception are not correlated. This indicates that society is moving towards a more progressive and egalitarian understanding of gender roles and expectations.*

Keywords: *Feminism Ideologies, Feminist Attitudes, Gender Role Perception, gender, feminism*

INTRODUCTION

Feminism ideologies are a theory about equality--- a set of beliefs and ideas that belongs to the broad social and political movement to achieve greater equality for women. Furthermore, not only is feminism essential for women but also for people of all sexes, genders, professions, and belief systems. It gives individuals and society more power. The idea that feminists can only be women is a widespread one. Being a component of a more significant social movement, the women's movement developed in the Philippines and responded to the demands of the time. The women's movement changed over time because of responses to shifting socioeconomic conditions and the nature of their struggle (Li, 2020). The reason for this is that to understand the current aspects of the movement, it is necessary to demonstrate how women have historically contributed significantly to the nation's development, how actively they have participated in the

movement, and how their participation has affected the nation's history.

Meanwhile, gender can be further understood as the roles, attitudes, attributes, and behavior. Gender is a cultural concept that can be described by the societal categorization of men as masculine and women as feminine. As stated by Nicolecta (2015), role differences between sexes can be seen as manifestations of the values and norms of a social contract. The researchers pursued this study to provide knowledge and empower people about the nature of gender equality and gender role perception between men and women. Therefore, the researchers seek to gather data regarding the correlation of feminist ideologies to the gender role perception of female teachers at Calasiao Comprehensive National High School.

METHODS

As a descriptive-correlational study, the researchers surveyed 148 female teachers

of Calasiao Comprehensive National High School to describe their feminist perspective and how they perceive gender roles to investigate the relationship of the said variables. They adopted the "Feminist Perspective scale – Short form" by Henley, Spalding, & Kosta (2000). This scale is 36 items which assessed feminist attitudes and feminist behaviors. On the said instrument, the 30 attitudinal items are comprised of 6 subscales: (a) Conservative; (b) Liberal feminist; (c) Radical feminist; (d) Social feminist; (e) Cultural feminist; (f) Woman of Color/ Womanist. Moreover, the researchers also adopted the "Gender Role Attitudes by Gender, Means of the Agreement Scale" by Fenyes (2014), comprising 10 statements about gender role attitudes. The five statements measure the modern gender role attitudes, another five items measure the traditional gender role attitudes, and another five measure the traditional attitudes.

The overall score of the respondent's responses to the questionnaire was calculated using percentages. The researchers combined the scores to obtain a total score for feminist attitudes and took the most dominant per individual for correlating the two variables by Chi-square test.

RESULTS AND DISCUSSION

The researchers arrived with the following results of the survey:

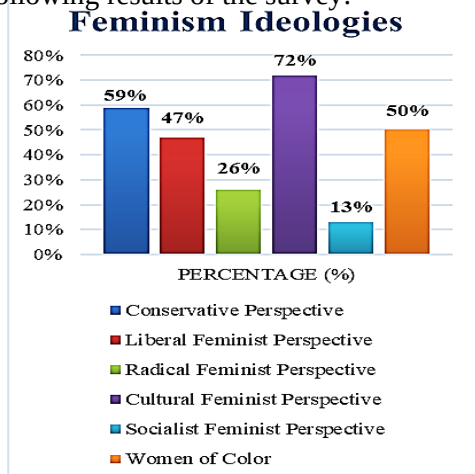

Figure 2. Feminism Ideologies of Respondents

Figure 2 shows the feminist ideologies of female teachers of Calasiao Comprehensive National High School. The Cultural Feminist Perspective and Conservative Feminist Perspective was the highest percentage among the six subscales, rated 72% and 59%. The cultural feminist perspective and the Conservative feminist perspective are different because they prioritize different aspects of feminism. Assi (2019) emphasizes the importance of recognizing and valuing the unique contributions of women to culture, history, and social life. Female teachers with a cultural feminist perspective can help create inclusive classrooms that honor and respect students' diverse backgrounds and perspectives. Meanwhile, Posner (1989) states that it emphasizes the value of women embracing their femininity and pursuing their goals within traditional roles. Female teachers who espouse this perspective can serve as role models for young girls, showing them they can excel academically and professionally while embracing their unique qualities as women.

The Radical Feminist Perspective and Socialist Feminist Perspective was the lowest percentage among the six subscales, rated 29% and 13% of female teachers. The radical feminist perspective and the socialist feminist perspective are different in their approaches to understanding and addressing gender inequality. Mandel (2023) states that it emphasizes women's subordination that is not merely a result of individual choices or attitudes but is deeply ingrained in social, political, and economic systems. The radical feminist perspective on female teachers holds particular importance in understanding and addressing issues related to gender equality, education, and women's experience in teaching professions. On the other hand, according to Armstrong (2020), socialist

feminism plays an influential role in oppressively shaping women's lives. Thus, socialist feminism sought to synthesize feminist analyses of gender inequality, social reproduction, and economic reproduction. Socialist feminism provides a structural analysis of gender oppression, focusing on how capitalism and patriarchal systems are interconnected. The perspective of socialist feminism highlights the need to address these gendered disparities and advocate for fair compensation and equal opportunities for female teachers.

The findings that the Cultural Feminist Perspective of female teachers are dominant among subscales are women that may have experienced or witnessed gender inequalities and discrimination in various aspects of their lives. Teaching is often associated with nurturing and caring for students, which aligns with the values emphasized by cultural feminists. Female teachers who are often socialized to be caregivers may find resonance with cultural feminist ideas that prioritize qualities such as empathy, relational skills, and collaborative learning environments.

Table 1. Feminist Behavior of Female Teachers

Feminist Behavior	Mean	%
Perspectives	25.1	60%

Table 1 shows the feminist behavior of female teachers of Calasiao Comprehensive National High School, which rated 60%. It indicates that most female teachers still believe in ideologies, attitudes, and actions that promote gender equality and challenges regarding social, political, and economic inequalities that affect women. Therefore, feminist behavior still exists in female teachers despite their feminist perspectives. The study of Ghofati & Mideni about feminism and its impact on modern society indicated that feminist behavior was efficient in many ways, in which they

brought a massive change in the position and the role of women. They were able to remove the majority, if not all, of the stereotypical pictures and to give them more importance in society by giving them political, social, and economic rights.

Meanwhile, the gender role perception of female teachers of Calasiao Comprehensive National High School is presented below:

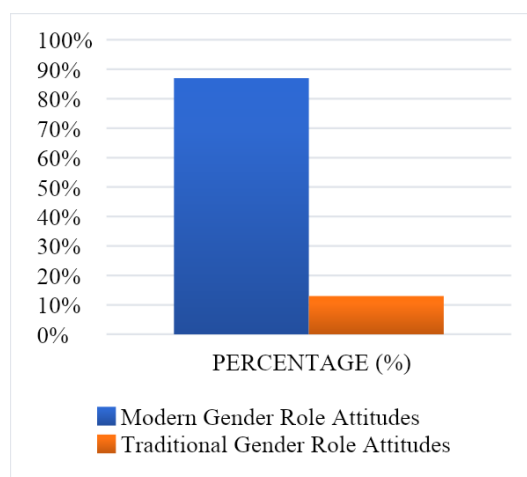

Figure 3. The Gender Role Perception of Female Teachers

Figure 3 shows the gender role perception of female teachers of Calasiao Comprehensive National High School. Modern Gender Role Attitudes were dominant over Traditional Gender Role Attitudes. The data shows the percentage of Modern Gender Role Attitudes, which rated 87% of female teachers, while the percentage of Traditional Gender Role Attitudes is 13%. This result finding is evident that female teachers who identify as feminists may approach the manifestation of modern gender role attitudes in educational settings from a specific perspective that emphasizes gender equality.

According to Fenyes (2014), in this study, the researcher examined the students' views on modern and traditional gender role

attitudes. The researcher found that religiosity significantly impacts the acceptance of traditional gender roles. In addition, the researcher also records the novel finding that respondents are likelier to belong to the postmaterialist-postmodern type. Inglehart & Norris (2003) examined how traditional gender role attitudes changed in 70 countries in the 20th century. As a result of modernization, modern gender role attitudes have become more popular, and the acceptance of traditional gender role attitudes is decreasing.

Another study was conducted by Tallichet (1986) about gender role attitude change in young women. This study indicated that women who shifted their attitudes toward modern forms would be expected to relate to their exposure to the non-traditional role behavior of significant others and their own traditional or non-traditional gender-role choices.

The teaching profession often emphasizes equality, fairness, and inclusivity. Teachers are responsible for nurturing and educating children, including promoting equal opportunities for all students, regardless of gender. Therefore, female teachers in this environment are more likely to align with modern gender role attitudes than traditional gender role attitudes.

Table 2 shows that the p-value (0.742) is more significant than 0.05, so the researchers will not reject the null hypothesis. Cultural Feminist Perspectives do not correlate with Modern Gender Role Perception. Therefore, although most female teachers are deeply rooted in Culture and Conservative Feminist perspectives, they typically manifest modern gender role perceptions.

Table 2. Chi-Square Test Results

χ^2	df	p-value	Decision
1.97	4	0.742	Not Rejected

In support, Lewis (2021) conducted

a study about Gender Role Identity and Attitudes Toward Feminism. The researcher found that feminism ideologies and gender role perception have a negative and significant relationship. It indicates that women increased femininity and men's increased masculinity would be associated with negative attitudes toward feminism, negative attitudes toward non-traditional gender roles, and unwillingness to consider oneself as a feminist. Additionally, as stated by Toller et al. (2004), feminism ideologies and gender role perception are not correlated but significantly impact one another. Therefore, it indicates that individuals who support feminism view their performance of masculinity or femininity as more non-traditional.

Similarly, Cameron & Lalonde (2001) found that feminism was positively correlated with women's perception of sexual harassment, while passive acceptance of traditional gender roles was positively correlated with tolerance of sexual harassment. It indicates that feminism ideologies and gender role perception are not positively correlated but can correlate to other factors.

CONCLUSIONS & RECOMMENDATIONS

There is a growing trend of female teachers identifying with cultural perspective feminism. There is also a low rate of female teachers identifying as liberal perspective feminists. The dominant feminist attitude among female teachers is cultural feminism, while socialist feminism has the lowest percentage. When combining the findings from the examination of gender role perception and gender attitudes, it becomes clear that modern gender role attitudes prevail over traditional ones. The study's variables do not exhibit a correlation, which suggests that each factor may have an individual influence. Society is moving towards a more progressive and egalitarian

understanding of gender roles and expectations.

Discrimination among genders is still evident in our country; this study recommends continuously empowering women and promoting gender equality. Gender equality has a benefit for men and women. For men and women, gender equality would let them live a life without having to experience gender discrimination, and it will protect their rights as human beings. Moreover, the focus of this study is feminism ideologies and gender role perception, and it is recommended to become more open about different gender to stop gender discrimination and achieve gender equality by empowering and supporting different gender.

STUDY HABITS OF SENIOR HIGH SCHOOL STUDENTS AT CALASIAO COMPREHENSIVE NATIONAL HIGH SCHOOL

Mark Jay A. Alegria, Bernadette Alexa C. Lapurga, Jamiah M. Laforteza, Alhea Glen L. Baldoz, Althea Gail D. Castil, and Patricio C. Geminiano

Genesis S. Parel, MAEd
Research Adviser

Abstract - This study was undertaken to determine the study habits of senior high school students at Calasiao Comprehensive National High School. The researcher examined the profile of the respondents, their performance in terms of their quarterly average, and their study habits in reading, notetaking, reviewing, preparing for tests, and time management. They utilized and adapted a modified survey questionnaire, which underwent validation and reliability testing. The researchers found a 29.37% drop in students who achieved 'With Honors' on the second grading (54) from the first grading (148), which results in students needing better study habits in the second grading. The researchers believe this drop is due to procrastination and offline and online addiction. Students are generally Evident, which means students have good study habits on the criteria, but there is still room for improvement. Every strand has different results on studying, reviewing, time management, and study habits based on their academic performance. Students also have good study habits, although this can still improve techniques and skills in different domains.

Keywords: *senior high school students, study habits, academic performance*

INTRODUCTION

Study habits are behaviors that students establish when studying as a means of learning. Study habits also demonstrate the extent to which a student engages in regular study activities, defined by a consistent study schedule, including frequency of study sessions, content reviews, and conducive conditions for learning. Studying students' study habits is relatively typical, but this study is noteworthy since the researchers can identify with the participants. Thus, the researchers investigated this fascinating subject to evaluate the various study practices of senior high school students. Students face increasing pressure to develop effective study habits that optimize their learning and enhance their academic performance. Study habits can be divided into good and bad categories. Some students can alter their behaviors in these classes by

creating a scheduler or improving their time management to have good study habits.

Furthermore, some students may be progressively adjusting their study habits because of the lockdown resulting in distance learning classes, and some students may find it challenging to do so, according to Sinocruz and Daing (2021). According to Rabia (2019), some causes are procrastination, learning techniques, and distractions like mobile phones, online games, and online and offline addictions. Improving study techniques might reduce the time spent studying and free up more time for other activities. The study habits of people who are in the educational process will determine the study abilities they will have and will always decide their level of academic accomplishment. This research aims to identify the study habits of senior high school students and their study habits based on

academic performance and study habits based on the different domains.

METHODS

The researchers used descriptive design to collect quantitative data by surveying senior high school students of Calasiao Comprehensive National High School for SY 2022 - 2023. They sampled 320 students using a stratified sampling technique used. Thus, in one thousand seventy-three students of Grade 11, 23 students from ABM, 53 from HUMSS, 42 from STEM, 35 from HE, and 23 from ICT. Also, eight hundred eighty-six students of Grade 12, 24 students from ABM, 42 from HUMSS, 38 from STEM, 20 from HE, and 20 from ICT. The overall score of each respondent's questionnaire responses was calculated using frequency and percentage distribution.

The researchers used and modified the questionnaire Sinocruz and Daing (2022) created for data collection and used descriptive statistics to analyze data quantitatively.

RESULTS AND DISCUSSION

The researchers discovered a 29.37% decrease in the number of students who had received "With Honors" in the second quarter (54) compared to the first quarter (148).

Figure 1. Quarterly Academic Performance of the Respondents

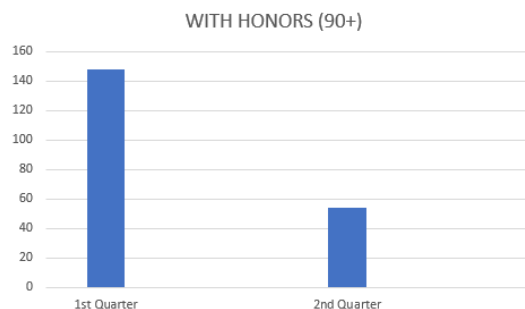

Figure 1 indicates that students had poor study habits during the second grading period. The researchers believed that this

drop could be attributed to procrastination and addiction to online and offline distractions.

Additionally, most students chose academic strands over vocational strands, indicating their preference for pursuing academic pathways in college.

Figure 2. Study Habits Based on Academic Performance

Based on the available written works, students generally had good study habits, as indicated by a mean score of 3.70 (Evident). However, there was room for improvement in their study habits, particularly in indicator 1.2, where most students showed moderate evidence. Students demonstrated evident study habits based on their academic performance for the other indicators. Students also exhibited good study habits in performance tasks, with a weighted mean score of 3.55 (Evident). However, there was still potential for improvement, as indicated by the moderate evidence in indicators 2.3 and 2.4. Students could have enhanced their study habits by implementing suggested techniques to improve their performance task outcomes.

Regarding quarterly assessments, students achieved impressive scores in indicator 3.1, with the majority demonstrating a "Very Evident" level. Indicator 3.2 showed that most students had evident study habits in this area. While students already possessed good study habits for quarterly assessments, there was still room for improvement. Students could have benefited from the researchers' suggestions based on Sinocruz and Daing's (2021) techniques to enhance their exam scores further. Overall, while students demonstrated good study habits based on the available

evidence, there were specific areas where improvement was needed. Students could have enhanced their study habits and academic performance by implementing suggested techniques and recommendations.

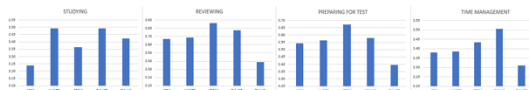

Figure 3. Study Habits Based on the Different Domains

Students generally had good study habits across different domains, with most responses falling into Moderately Evident and Evident categories. This indicated that students had good study habits, but there was still room for improvement. To enhance their study habits in these domains, students could have followed the suggestions provided by researchers, as highlighted in the studies conducted by Cirillo (2018) and Sinocruz and Daing (2021). These suggestions have been proven to improve student behaviors, techniques, and skills, increasing productivity in various domains. By implementing these suggestions, students could have further enhanced their study habits and excelled academically.

Meanwhile, Figure 4 revealed that based on written works, the STEM strand has the highest mean, 3.82, and the strand with the lowest mean is ABM, with 3.57.

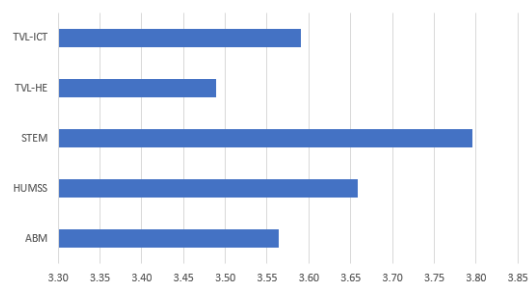

Figure 4. Overall Study Habits of Students' Strand in Terms of Academic Performance

The STEM strand again has the highest mean, 3.70, and the strand with the lowest mean is TVL-HE, with 3.43. Lastly,

on Quarterly Assessment, the STEM strand again has the highest mean, 3.83, and TVL-HE has the lowest mean, 3.60. In conclusion, STEM is the strand with good study habits based on academic performance dominating the three domains, respectively. Meanwhile, ABM and TVL-HE is the strand with the lowest study habits based on academic performance.

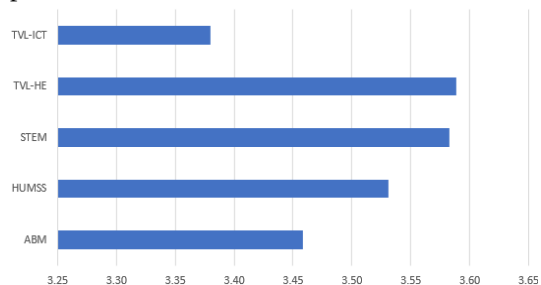

Figure 5. Overall Study Habits of Students' Strand Based on the Different Domains

The researchers' findings on different domains of study habits among senior high school students indicated variations in performance across different strands. Regarding studying, the ABM strand performed the least in both Grade 11 and Grade 12, while the HUMSS strand consistently performed the best. For reviewing, the TVL-ICT showed the lowest performance in Grade 11, whereas the STEM strand performed the best. In Grade 12, TVL-ICT remained the least-performing strand in reviewing, while TVL-HE emerged as the best-performing strand. Regarding test preparation, in Grade 11, TVL-ICT performed the least, while ABM and STEM strands demonstrated the best performance. In Grade 12, ABM performed the least, and TVL-HE performed the best in preparing for tests. Finally, in terms of time management, TVL-ICT exhibited the lowest performance in both Grade 11 and Grade 12, while TVL-HE consistently demonstrated the best performance. These findings suggested that different strands had varying strengths and weaknesses in different domains of study

habits.

CONCLUSION & RECOMMENDATION

STEM 11 and ABM 12 are the best-performing strands in written work. These strands have the most noticeable study habits, as evidenced by their high marks on short and long quizzes, unit tests, and essays. Based on the performance task, STEM 11 and TVL-HE 12 are the best-performing strands. These strands also have the best study habits, which include reciting in class, performing well during presentations, applying their knowledge, and doing well on projects. Lastly, according to the results of the quarterly assessment, STEM 11 and TVL-HE 12 are once more the best-performing strands, which suggests that they have the best study habits regarding the quarterly assessment, which includes preparing for the exam and performing well.

HUMSS 11 and TVL-HE 12 have the most apparent reviewing habits, as shown by their answers when prompted to review their topics, read new lessons, summarize their notes for better understanding, and test themselves on material that may be on future quizzes, while strands that review the most are TVL-HE 12 and STEM 11. These strands have the most evident study habits, as evidenced by their responses to surveys asking whether they study in an area with few distractions and peace, whether they take breaks between studying sessions, whether they keep their supplies close at hand, and whether they make goals like the number of problems they will complete or the number of pages they will read. ABM and STEM 11 best prepare for tests followed by TVL-HE 12. This suggests that these strands have the best study habits, as shown by surveys asking students whether they were studying in groups or with classmates, whether they could quickly distinguish between what they already knew and what they still needed to learn before taking a test, whether they

avoided distractions while preparing, and whether they anticipated the kinds of questions that might be on their test. Last but not least, TVL-HE 11 and TVL-HE 12 have the highest mean scores for time management, suggesting that these strands have the most apparent study habits, as shown by the survey when participants were asked if they have enough time for school and fun, if they take time to study every day if they start projects as soon as they are assigned and if they use a planner or other method to record their upcoming academic and social commitments.

Teachers should promote a positive attitude toward learning among students by teaching them the techniques needed for effective studying. These techniques include helping students form habits such as managing their time, reviewing, and preparing for tests/examinations. Heads of Senior High Schools should also arrange for periodic guidance and counseling sessions for teachers and students on improving students' study habits. Senior High School Students should enhance their study habits in Studying, Reviewing, Preparing for tests, and time management by doing the suggested techniques on improving their skills and techniques to get productive in the different domains. They should practice good time management to have enough time to complete their schoolwork, specifically reviewing, studying, and preparing for tests. Lastly, parents and guardians should encourage their children to make a study schedule, especially in studies, that will provide them enough time to study at home; Teachers should educate students during orientation to encourage them to improve their studying, reviewing, Preparing for tests, and Time Management.

FINANCIAL MANAGEMENT OF SENIOR HIGH SCHOOL STUDENTS OF CALASIAO COMPREHENSIVE NATIONAL HIGH SCHOOL

Brent Justin P. Dela Cruz, Raden John S. Vallo, Jade P. Domalanta, John Michael P. Diocares, Jennylyn G. Caragay, John Gil V. Roxas, and Roderick B. Aquino Jr.

Genesis S. Parel, MAEd
Research Adviser

Abstract - The research entitled *FINANCIAL MANAGEMENT OF SENIOR HIGH SCHOOL STUDENTS OF CALASIAO COMPREHENSIVE NATIONAL HIGH SCHOOL* has the purpose of determining the common financial challenges and the level of financial challenges of the respondents, which are the senior high school students of Calasiao Comprehensive National High School. The researchers made use of a descriptive research design to determine the objectives of the study. The researchers used a self-administered survey questionnaire to draw data from the respondents. The researchers also used different statistical tools, such as frequency and percentage distribution and weighted mean, to analyze and interpret the data. The findings show that the majority of the respondents are 17 (52%) and have four or more siblings (40%). The findings also show that almost all of the financial challenges indicated by the researchers have high frequency, particularly in terms of no savings and a lack of allowance. The findings revealed that the respondents are budgeting and saving their allowances but need to improve in terms of investing. This is because the majority of the respondents have four or more siblings in their families. In conclusion, the researchers found out that the common financial challenges of senior high school students at Calasiao Comprehensive National High School are a lack of allowance and no savings. Though the respondents are good at managing their finances, it is encouraging that they still need to improve more in terms of investing.

Calasiao Comprehensive National High School – Senior High School
Humanities and Social Sciences
Calasiao, Pangasinan

INTRODUCTION

The purchasing power of today's youth is said to be greater than that of any previous generation. This demonstrates that the generation wields power that will continue to have an impact on the world's economies. As a child, he or she should be exposed to financial management. The reason for this is that financial habits formed during adolescence persist into adulthood. Youth spending habits and their limited understanding of cash management strengthen tendencies that can lead to costly budgetary errors today and in the future. Financial management is important for

students because it teaches them important life skills such as budgeting, goal setting, and saving. Good money management habits will benefit students for the rest of their lives, whether they deal with personal or business finances. As a child grows, so do his or her needs. Certain products, such as food or project materials, are not available to all children. In terms of school and personal expenses, teenagers face unique challenges. The majority of teenagers receive financial support from their parents. As previously stated, youth frequently overlook the difficulty of obtaining money. Teenagers' spending habits, upbringing, lifestyle, economic status, and other factors all have an impact on how they spend their money. In the Philippines, most children are still likely to live with their parents during their senior high school and college years, even though their needs have significantly increased in comparison to before. Laptops, cell phones, internet connections, and even personal vehicles are now required for students to attend and complete their studies. As a result, students' spending habits today are bound to differ significantly from students' spending habits in the past. Students need to learn how to handle their finances as they mature. Humans now need the practical ability of budgeting if they want to keep and advance their social status. Students frequently waste money because they do not prioritize their spending properly. Many college students decide not to skip this fee. The ability to stick to a budget reveals a person's spending and saving patterns. The primary objective of this study was to measure the level of financial management among senior high school students at Calasiao Comprehensive National High School. This study also provided information about the common financial issues faced by senior high school students as well as recommendations for teachers, students, parents, and future researchers.

METHODS

For this study, the researchers used a Descriptive Research design. The researchers used a self-administered questionnaire to collect data. The first part is where you can find the demographic profile of the respondents, part two is the level of agreement on common financial challenges, and part three is the level of financial management.

To ensure the validity of the instrument, the questionnaire was validated by Accounting and Business Management and Humanities and Social Sciences teachers who are capable of properly validating questionnaires about this kind of discussion. The result of the content validity in mean scale value is 4.66 which falls under highly valid. The rater agreement between the validators was also examined by calculating the Fleiss-Kappa to ensure reliability. The result of the validator interpretation was 0.46, indicating a Moderate Agreement. The results show that the data collection instrument has acceptable validity and reliability.

The researchers used a 5-point Likert scale to determine the level of financial management of Senior High School students at Calasiao Comprehensive National High School. The researchers also used frequency and percentage distribution to determine the demographic profile and the common financial challenges of the respondents.

The sampling technique used by the researchers is stratified sampling. The researchers' target population is senior high school students at Calasiao Comprehensive National High School. The total population of senior high school students is one thousand nine hundred sixty-one (1961), using Cochran's

Calasiao Comprehensive National High School – Senior High School
Humanities and Social Sciences
Calasiao, Pangasinan

Formula, the researchers come up with a three hundred twenty-two (322) sample size.

RESULTS AND DISCUSSION

The respondents' demographic profiles will be determined by the researchers. The frequency and percentage distribution for age, sex, and the number of siblings are shown in the table.

Profile	Category	Frequency (f)	Percentage (%)
Age	16 years old	56	17%
	17 years old	168	52%
	18 years old	82	25%
	19 years old	13	4%
	20 years old above	3	1%
	Total	322	100%
Sex	Male	149	46%
	Female	173	54%
	Total	322	100%
Number of Siblings	Only Child	39	12%
	Two	79	25%
	Three	74	23%
	Four or more	130	40%
	Total	322	100%

Table 1. Demographic Profile of the Respondents

The distribution of respondents by age is seen in Table 1. The findings are normal, as evidenced by the fact that the majority of Calasiao Comprehensive National High School senior high school students are 17 years old (52%), and 18 years old (25%). The table above presents the distribution of respondents in terms of sex. The data results show that out of 322 respondents, 149 (46%) are male and 173 (54%) are female. The table above also presents the distribution of respondents in terms of the number of siblings. The data results show that out of 322 respondents, Most of the respondents have four or more siblings (40%). The number of siblings in a household further limits the resources which may manifest in the distribution of allowance, which would result in financial challenges and issues (Greenspan, 1992).

The researchers also gathered information on common financial challenges and issues during this time. The overall number of votes and the percentage for each financial issue and challenge are shown in the table below.

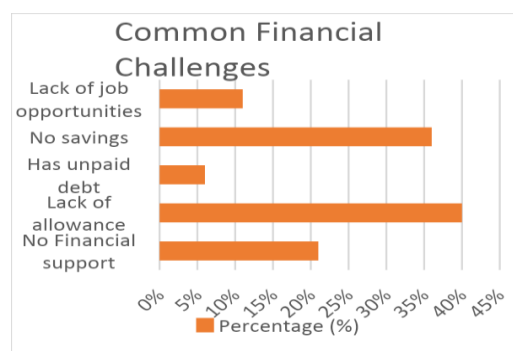

Figure 1. Common Financial Challenges of the Respondents

The findings show that the common financial challenges indicated by the researchers have high frequencies in the population, particularly the lack of allowance and no savings, except for unpaid debt, which got the lowest percentage. This could be because almost half of the respondents have four or more siblings. The findings also support the article by Keller (2018), which stated that two of the most common financial issues that students may experience are a lack of allowance and savings.

Meanwhile, the researchers will use a 5-point rating scale to determine the level of financial management of the respondents in terms of Budgeting, Saving, and Investing.

Table 2.. Level of Financial Management in terms of Budgeting

Calasiao Comprehensive National High School – Senior High School

Average Weighted Mean						3.57	Agree

Note: Highest frequencies are in boldface; WM= Weighted Mean
 Legend: 1.00-1.80, "SD" (Strongly Disagree); 1.81-2.60, "D" (Disagree); 2.61-3.40, "N" (Neutral); 3.41-4.20, "A" (Agree); 4.21-5.00, "SA" (Strongly Agree)

The table above indicates that the respondents agree that they prepare for upcoming expenses (3.71) and also determine what things should be on their priority list before spending money (3.79). These two indicators support the article by Miller (2022), which stated that the first budgeting technique is to track your future expenses and track your spending. Though the means indicate that the respondents generally agree on all indicators, the majority of the indicators scored neutral. The table above indicates that while respondents can budget their finances, their skills can further improve by having a budget plan, budgeting for various expenses, spending on necessities, and avoiding impulsive buying.

Table 3. Level of Financial Management in terms of Saving

Indicators	Frequency (f)					WM	Interpretation
	SA	A	N	D	SD		
7. I usually save a portion of my allowance.	103	96	78	38	7	3.78	Agree
8. I can save despite my limited allowance.	93	81	102	31	15	3.64	Agree
9. I have savings account for emergency funds.	59	81	76	47	59	3.11	Neutral
10. Instead of purchasing pricey items, I seek less expensive alternatives to save money.	98	72	84	44	24	3.55	Agree
Average Weighted Mean						3.52	Agree

Note: Highest frequencies are in boldface; WM= Weighted Mean
 Legend: 1.00-1.80, "SD" (Strongly Disagree); 1.81-2.60, "D" (Disagree); 2.61-3.40, "N" (Neutral); 3.41-4.20, "A" (Agree); 4.21-5.00, "SA" (Strongly Agree)

Based on the results, it indicates that the respondents agreed on every indicator except having a savings account for emergency funds, this is because the majority of the respondents are 17 years old and are not able to open a savings account. Sylvio (2019) stated students might struggle with the requirements for getting a savings account because getting a valid government ID is not that easy and a lot of banks would ask for a huge initial deposit before allowing one to open an account. Overall, the respondents generally have sufficient skills in saving.

Table 4. Level of Financial Management in terms of Investing

Indicators	Frequency (f)					WM	Interpretation
	SA	A	N	D	SD		
7. I usually save a portion of my allowance.	103	96	78	38	7	3.78	Agree
8. I can save despite my limited allowance.	93	81	102	31	15	3.64	Agree
9. I have savings account for emergency funds.	59	81	76	47	59	3.11	Neutral
10. Instead of purchasing pricey items, I seek less expensive alternatives to save money.	98	72	84	44	24	3.55	Agree
Average Weighted Mean						3.52	Agree

Note: Highest frequencies are in boldface; WM= Weighted Mean
 Legend: 1.00-1.80, "SD" (Strongly Disagree); 1.81-2.60, "D" (Disagree); 2.61-3.40, "N" (Neutral); 3.41-4.20, "A" (Agree); 4.21-5.00, "SA" (Strongly Agree)

Based on the findings in the table above, the mean of the respondents' responses scored Neutral in all indicators except for purchasing items using extra allowance that could increase in value. Most of the respondents also do not have any form of investment (86). Generally speaking, the responses indicate neutral in terms of investing. Overall, these results suggest insufficient skills for investment in the population. As stated by Nidar (2012), the personal financial literacy of students falls within the low

Calasiao Comprehensive National High School – Senior High School
Humanities and Social Sciences
Calasiao, Pangasinan

category in terms of investing and therefore needs to be improved.

CONCLUSION & RECOMMENDATION

The senior high school students of Calasiao Comprehensive National High School are aged around 17–18 years old, with an almost equal number of males and females. Since almost half of the respondents have four or more siblings, this may further limit the resources and affect the distribution of allowance, which may result in financial challenges and issues. The common financial challenges and issues that senior high school students at Calasiao Comprehensive National High School face are a lack of allowance and savings. The senior high school students from Calasiao Comprehensive National High School have adequate skills in financial management, particularly in budgeting and saving, though they can still improve, especially in investing.

Since almost all of the respondents have four or more siblings, researchers recommend that the parents of the respondents adjust their children's allowances based on their age and needs, allowing students to avoid financial difficulties. Since most of the respondents do not have enough allowance and savings, they may apply for a part-time job to sustain their daily needs. This way, they can have financial stability and avoid any financial challenges. Since the senior high school students of Calasiao Comprehensive National High School are pretty good at budgeting and saving their finances but not that good at investing their finances, the respondents should read or watch blogs or videos about financial management to gather some knowledge, especially in terms of investing.
